1. Internet acces using Packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-01 00:45:26 UTC
From: ccopeland@aol.com
Message-ID: <3e4tv6$6ev@newsbf02.news.aol.com>
Source record: 45582

I know little to nothing about packet other than its based in tcpip.

Is it possible to log onto the internet using packet?
Seems there could be a generic account that would allow one to
telnet to any personal account and go from there.

The NORAD convention is that periods longer than 225 minutes (3 hr 45 min) are considered "deep space". Different sensors are used to track deep space and low orbit satellites.

Relatively few satellites have periods near 225 minutes because that puts them in the heart of the Van Allen belts, so the exact value isn't that crucial.

GPS satellites are in 12 hour (sidereal) orbits so they definitely qualify as deep space.

Phil

BTW, this is why we lost the bottom of the 23cm band (1215-1240 Mhz) some years back.

GPS was sold to Congress on it being able to replace a lot of existing radionavigation systems. Sure would be nice if it could deliver on that promise -- that would free up a lot of spectrum.

To really meet the FCC's requirements in a pure TCP/IP packet network,
every user would pretty much have to sign every packet with a public
key. That's just not practical, even at the snail speed modems we use.

Phil

5. hookup ?

Newsgroup: rec.radio.amateur.digital.misc

I have a Radio Shack HTX-202 that I would like to use for packet with my PK232. My question is how to hook up the ptt to the mike jack. In the manual it shows the connector is a 2 wire setup with the ptt as a switch. If I am not mistaken the 232 sends a positive or negative voltage as ptt. I'm sure that this is not the first time this question has come up, but I have been checking ftp sites for an answer and can't find anything. Tnx and 73.

I was wondering, under fcc rules (USA), if it was illegal for a packet user on 2m to use a gateway to transmit on a HF frequency, if the user has no priviliges on HF. Thanks in advance.

You have to take the TX audio output and put a 2.2 K ohm resistor in it
and take the ptt line and put a .1 uf capacitor in it and take both ends
and hook them up to the TX audio input to the rig. The rx audio goes to
the ear jack along with the ground. It takes 4 connections in actuallity.
You can get a hint from the section in the back of the manual showing the
rig hookups according to the ICOM HT and Yeasu HT sections. It all
depends upon the mic plug used in your HT. Like this:

```
-------TX Audio------/\/\/\--------------\
2.2 K ohm \
-------PTT----------------------)|---------o--------mic plug input
0.1 uf
-------RX Audio-------------------------------------ear jack +
-------Ground--------------------------------o-------ear jack -
-------Shield------------------------------/
```

TNC HT

Hope this helps.

>that was interesting about ham radio. And Part 15 will take what's
>left.

And as I have said for some years now, the reason amateur radio is not expanding and attracting lots of technically qualified young people is that computers offer so much more challenge with so much less hassle...

I am on my soapbox now as a result of Phil Karn's comment...

I will have been a ham for 40 years, this May... I have seen a lot of changes in the hobby in those 40 years... When I got my license at age 15 my ham friends were boys who went on to be PhD's and lawyers and businessmen and community leaders... Where are those young people today... They are playing with computers and one visit to the local amateur radio club meeting and they know they want no part of that scene... (Unless, of course, your club is different from mine...)

Most of us old guys who really loved ham radio when we were kids are still here primarily because we are still trying to rekindle that wonderful feeling of awe and amazement we had the first time we made a contact on the radio from our bedroom... Or the tremendous feeling of accomplishment we felt when we got that Heath AT-1 built and operating... Where is that feeling now for young people... It's plugging a modem in and surfing the internet, I guess...

In the last 15 years I have seen all the technically talented people in ham radio loose interest in favor of learning about computers... We have applied this computer interest in some ways to ham radio... But because of regulations restricting development in this technically expanding society, it has stagnated... Ham Radio cannot expect to be at the forefront of technology, as it has been in the past, with technical restrictions... We were about to have one of the best private message forwarding systems ever seen, until the BBS restrictions were imposed... Hams, being the by-the-rules kind of players they are, backed off...

So with all this Republican whoop-de-la about reducing the size of government, I have a suggestion... As anyone who has ever had to deal with the FCC on a regular basis will tell you, the FCC could care less what Hams do, as long as they aren't hearing any complaints about it... Based on that, my suggestion is that Amateur Radio be totally deregulated with the following exceptions... Maximum power output - 100 watts... CW requirements - 5 words per minute max for everyone... No restrictions on

operating frequencies within the currently defined bands... No restrictions on types or frequency allocations of operating modes...

Obviously this is a simplistic approach but it's a starting point... And, yes, I am aware that there are lots of problems... But, on this first day of the year 1995, lets make a fresh start with Amateur Radio... Lets get the ball rolling for some significant changes here... Let's put some snap back into Amateur Radio... Let's let people use Amateur Radio as a technical building block and personal radio service it was designed to be... Amateur Radio is a national treasure that is dying... Let's do something for Ham Radio...

I'm going to do my share... I'm going to turn this into a full blown article and get it published in some rag... Even old Wayne's rag if necessary... My New Year's resolution...!!!

Next...!!!

I found a way to reduce interferance from an amateur transciever to a CRT. All you have to do is put a piece of aluminum foil in the way of the signals from the transciever to the sides of the screen. the front does not really matter. It seems to work gre at. I found this correction, because my sister was complaining about interferance to the monitor of the computer she was on when I was doing packet on the other one. Another great way to reduce interferance is to move the antenna away from the screen. I f ound that on an HT, moving it a foot or two reduces interferance dramatically. Just though you might want to know. This seems it might work good for front end overload on TVs too.

The FCC did not define what constitutes authentication.

How about Kerberos 4 for packet radio?

A log file that keeps all the header information from every
packet received so that a traceroute like program can be used
to trace the packet back to its source. (I've always suspected
that the real purpose of packet radio is to deliver headers
and not content).

Perhaps install clipper chips in every TNC and give half the
code to the FCC so they can track down the perpetrator(s)?

Install Lat/Long location in every header and authenticate
the location of every packet station? This would unfortunately
make mobile and portable packet radio impossible.

Maybe the radio manufacturers should install identifiers in
every transmitter that belches the serial number of the radio
every few minutes? (This would be from that same clowns that
won't install a 3 minute timer for stuck transmitters).

Or maybe not do any authentication, assume full responsibility
for content and go into the censorship business. Give the
"radio police" some real teeth. I know a few chronic complainers
about the "commercialization" of packet radio that should jump
at the opertunity to enforce their opinions.

Sometimes, I wonder which is worse; a neanderthal ham radio
establishment, or a reactionary FCC. Either way, the future
looks bleak.

No way to losing the tests! Too much to know already, and the crap
banders would have a field day. As far as computers are concerned, they
play a very integral part in High Tech amateur work, like satellites and
TCP/IP protocols. If I had my druthers, Amateurs would be more interested
in doing valid research and testing of new forums, like Spread Spectrum
and high speed duplex data, but we'll have to wait and see what the
future will hold for us. Anyone who thinks that amateur radio is just a bunch
of people sitting around talking hasn't been exposed to the 90's ham.
Most of the discussions on our local repeater deal specifically with
computers and other high tech stuff, and as a result we've had most of
the local hams get experience with packet/satellite tracking/multitasking
and Telephone bbs and internet connections. Not a day goes by that
another question doesn't come up that needs serious research to answer,
and we're constantly revising and testing new programs, in the hopes of
learning something. If this sounds like your bag, by all means an amateur
ticket could just be your ticket to success in the electronics and
information age. 73.
p.s. To quote a friend, "Experiment! Try something new!"

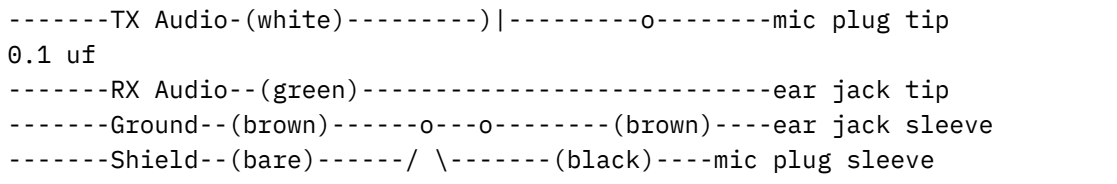
OUCH!!!!!!!

This diagram and text is incorrect. The TX Audio goes through the 0.1
uF capacitor and the PTT goes through the 2.2 kOhm resistor. As owner
of PK-232 #10 (yes, the tenth one shipped) and a former AEA Tech Support
person, I can also tell you factually that the PK-232 PTT circuit does
not provide a voltage on the PTT line. It uses a transistor switch to
complete a circuit from the PTT line to ground when the PK-232 wants to
transmit. The positive/negative PTT jumpers in the PK-232 simply direct
the PTT signal to the PTT switch transistor that can handle a
voltage/current source that is positive or negative with respect to
ground. The corrected diagram below:

-------PTT--(red)----/\/\/\--------------\
2200 ohm \



The following is a step-by-step proceedure I've used to build rugged, reliable radio cables for Icom/Yaesu/Alinco/Tandy/Standard handheld radios.

The construction techinique I use is to locate a 1/4 watt 2200 Ohm resistor and a similarly sized and styled (axial lead) 0.1 uF capacitor, along with 4.000 inches of 0.312 inch diameter heat shrinkable tubing (heat shrink) and about 6.00 inches of either 0.125 inch or 0.156 inch diameter heat shrink. I strongly reccomend using heat shrink as it provides a neat, rugged covering for the components and wires. Cables I've made this way have lasted for years.

1) Slide 2 pieces of 2.000 inch long 0.312 inch diameter heat shrink over the cable and push it up the cable out of the way. It gets shrunk last.

2) Strip the AEA provided radio cable outer jacket back about 2.500 inches.

3) Cut the white and red wires to leave about 0.750 protruding from the end of the outer jacket. Cut the black wire flush with the jacket.

4) Strip the red and white wires back about 0.250 inches.

5) Wrap the red wire around an end of the 2200 Ohm resistor in the manner of a splice, and solder it.

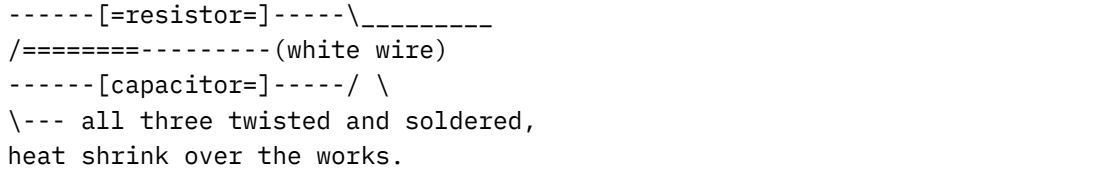
6) Slide a 0.750 inch piece of 0.125 or 0.156 inch diameter heat shrink over the soldered and spliced connection, then shrink it.

7) Wrap the white wire around an end of the 0.1 uF capacitor in the manner of a splice, and solder it.

8) Slide a 0.750 inch piece of 0.125 or 0.156 inch diameter heat shrink over the soldered and spliced connection, then shrink it.

9) Strip 0.250 inches of insulation off of the scrap of white wire that you cut off in step 3.

10) Twist the exposed ends of the capacitor and resistor together. Leave enough lead so these components can be laid side by side without undue stress on the components. Twist the stripped end of the white wire on the other end of this assembly, in the manner of a splice, and solder all together.



11) Slide a 0.500 inch piece of 0.125 or 0.156 inch diameter heat shrink over the splice, and shrink it.

12) Center strip the brown wire about 0.750 inches from the jacket and create a 0.250 inch section of exposed wire. Center stripping means to cut the jacket and then slide the jacket along the wire inside until the amount you want to expose is exposed.

13) Wrap the bare shield wire around the brown wire. Cut off the excess bare shield wire - about 1.750 inches. DO NOT SOLDER - that's in the next step!

14) Strip 0.250 inches off of one end of the black wire. Wrap that stripped end around the brown wire and shield wire you just wrapped. Solder this connection.

15) Slide a 0.500 inch piece of 0.125 or 0.156 inch diameter heat shrink over the splice and shrink it.

16) Lay all the wires out side by side. Locate the shortest of the remaining wires, either the green or brown. Cut the green or brown (whichever is shorter) to match the other. Cut the white and black about 0.125 inches longer than the green and black.

17) Cut a piece of 0.125 or 0.156 inch diameter heat shrink so that it can be put over the green+brown wire pair with 0.500 inches of wire coming out of the end of the heat shrink. Do the same with the white+black wire pair. Do not shrink yet.

18) Slide the cover for the 2.5 mm plug over the white+black wire pair. Slide the cover for the 3.5 mm plug over the green+brown wire pair.

19) Strip the white, black, green, and brown wire jackets back about 0.125 inches. Tin all four wire ends, then bend hooks in them using needle-nose pliers.

20) Hook the white wire in the loop for the tip of the 2.5 mm plug, and solder. Hook the black wire through the hole for the sleeve connection from 'inside to outside' and solder. Use wire cutters to carefully trim excess from the black wire on the outside of sleeve connection.

21) Hook the green wire in the loop for the tip of the 2.5 mm plug, and solder. Hook the brown wire through the hole for the sleeve connection from 'inside to outside' and solder. Use wire cutters to carefully trim excess from the brown wire on the outside of sleeve connection.

22) Slide the lengths of heat shrink covering the black+white and brown+green sections towards the plugs snugly and shrink in place. Slide the plug covers down onto the plugs and screw in place.

23) Now slide one of the 0.312 inch diameter pieces of heat shrink over the area with the exposed wire jackets, so it covers from the plastic jacket of the AEA-supplied radio cable to the sections of

heat shrink we shrunk in step 20. Shrink the this piece here.
Slide the remaining piece over the first piece and shrink it in the
same place. This adds to the ruggedness of this potenially weakest
spot in the cable.

Hope that helps!

73, and Happy New Year

Bob

Hello All!

I think there was a posting a while back on a fix for X1J Rev 2. I've got a local node that runs out of buffers every few days and I'd like to give the fix a try.

Can anyone re-post the patch???

Thanks a bunch in advance!

: > -------Shield-----------------------------/
: >
: > TNC HT
: >
: > Hope this helps.

: OUCH!!!!!!!

: This diagram and text is incorrect. The TX Audio goes through the 0.1
: uF capacitor and the PTT goes through the 2.2 kOhm resistor. As owner
: of PK-232 #10 (yes, the tenth one shipped) and a former AEA Tech Support
: person, I can also tell you factually that the PK-232 PTT circuit does
: not provide a voltage on the PTT line. It uses a transistor switch to
: complete a circuit from the PTT line to ground when the PK-232 wants to
: transmit. The positive/negative PTT jumpers in the PK-232 simply direct
: the PTT signal to the PTT switch transistor that can handle a
: voltage/current source that is positive or negative with respect to
: ground. The corrected diagram below:

: -------PTT--(red)----/\/\/\--------------\
: 2200 ohm \
: -------TX Audio-(white)---------)|---------o--------mic plug tip
: 0.1 uf
: -------RX Audio--(green)----------------------------ear jack tip
: -------Ground--(brown)------o---o--------(brown)----ear jack sleeve
: -------Shield--(bare)------/ \-------(black)----mic plug sleeve

: The following is a step-by-step proceedure I've used to build rugged,
: reliable radio cables for Icom/Yaesu/Alinco/Tandy/Standard handheld
: radios.

Imagine my embarrassment!!!! Yes, the resistor is in the PTT line and the
capacitor is in the TX Audio line. I was looking at 2 different diagrams
and got confused in going back an forth between them. OOOPS! Thanks for

correcting me.

Phil,

I think the FCC is just like pretty much every other bureaucracy. As cdlevin said they just don't want to be bothered.

However, all bureaucracies respond to political pressure from above. It seems like the logical next step might be to apply a little heat. I have no idea where, but as a suggestion, it seems as though Al Gore might be a starting place. Perhaps a letter to him briefly outlining what you want to do and what you are meeting for opposition from the FCC.

>give the fix a try.
>
>Can anyone re-post the patch???
>
>Thanks a bunch in advance!
>
>Ray Semenoff VE6RHS

The author, Dave G8KBB said:

"To do the patch (in thenet X1J release2) debug the file THENET1.X1J and
look at the byte offset 0x13d8 into that file (if you are using DEBUG
under DOS don't forget that DEBUG will ass 0x100 so do a D 14d8) and the
byte at that address should be 0x2a. Change this to 0x24. This will
cause the code to call the memory deallocation routine."

We have now tested this at 2 nodes which would hang and it cured both of
them.

: Hello all,

: It seems like several months ago I recall a mention of software or
: source code for a DSP or sound card based SINAD calculator.

Bob -- I dunno if it's what you are referring to, but I wrote an article a while back in QEX about a DSP SINAD meter. ("Measuring SINAD Using DSP," QEX, June 1993.) It happened to use a TMS320C25 processor on an alpha-test version of a TAPR DSP board that never saw production. (They did a different design instead.) But the principle is simple enough. I've since implemented the same idea on a TI DSK, but embedded in some other testing application code. In any case, it should be fairly easy to implement on a sound card, although I haven't done that. The article discusses the techniques used and gives source code for the program I wrote for the defuct TAPR board. It should be easily portable to other TMS320C25 systems.

If you need to get a copy of this article (or any other QEX article), mail to lweinberg@arrl.org and tell us what you want. (There's a $3 charge per article.)

>
>Does anyone have any experience using these? Any comments on the claimed
>operating distance, or advice on replacement aerials to make them perform
>better? What about data throughput?
>

I do not have experience with the Ricochet units, but I am currently
evaluating a pair of FreeWave DGR-115's. These units will run up to 115k
on the serial async channel, and I am using two units over a 15 mile path
with 5 element yagis at about 20 feet. The manufacturer claims that the
units will go 20 miles line of site between top mounted rubber duck antennas!
All powered by a 12VDC/.5 amp supply. FreeWave is a relatively new company
in Boulder, CO.

I have been away from Ham Radio for a good while (2 years) while I was in
Misawa, Japan. Now I have returned and there are alot of new signals I
hear on my radio! (Radio was in storage for those years)

What is this PACTOR mode? Packet and Amtor mixed?
Also, there is talk about these high-speed packet modems!
Boy, I have been away from it all too long.

Goedenavond allemaal, zo net voor Sinterklaas avond hebben wij dan
het 14e World Link RTTY bulletin. Hebt U misschien nog net de tijd
om eens rond te kijken wat voor speeltjes Sinterklaas nog kan mee-
brengen.. Want U maakt toch tegenwoordig niks meer zelf. ??? Ben je
nu helemaal gek... Een beetje zendamateur heeft toch alleen maar van
die glimmende toeters en bellen waarmee hij zijn niets begrijpende
familie leden versteld doet staan.???? Of brengt St.Klaas in plaats
van grote dozen glimmer misschien bij U nog van die zakken vol met
onderdelen, zodat U de winter weer met veel plezier doorkomt.??? Ik
hoop dat het laatste bij U van toepassing is, en dat de Sint U nadat
hij allang weer in Spanje zit, U trots kunt laten zijn op wat U nu
dan toch maar weer hebt gemaakt..hi... Maar goed.. het is altijd nog
geen Sinterklaasavond dus heb geduld en lees gezellig verder met dit
```

Bulletin.. Inmelden kan weer tijdens de uitzending via (05125) 2702.
En straks natuurlijk wanneer wij QSY gaan naar 145.325 Mhz.....
Tot straks..... Weit, PA3ESF.

SATELLIETEN METEOSAT. In het kader van de ESA een afkorting van
---------- European Space Agency, zeg maar de europese
ruimte organisatie,(waarin een aantal europese landen zijn verenigd)
is er een type weersatelliet ontwikkeld die men de naam ''METEOSAT''
heeft gegeven Deze geostationaire satelliet is vanaf november 1977
gelanceerd naaar het snijpunt boven de evenaar en 0 (Greenwich) me-
ridiaan. Daarbij heeft de satelliet een uitzicht over Zuid- en
Midden-Europa, de Atlantische oceaan en Afrika. Van dit gebied maakt
de satelliet elk half uur een opname zowel met infrarood als zicht-
baar licht en zendt deze direkt over. Tevens wordt de satelliet
gebruikt als relais-station voor het centrale grondstation, dat na
bewerking de foto's en aanverwante gegevens heruitzend naar ander
stations. Ook geeft de Meteosat satelliet gegevens door die het
ontvangt van weer andere automatisch bediende weerstations, naar
ontvangstations op aarde.

FRANKRIJK, USSR. Van de Russische activiteiten op 't gebied van
========== meteorologische sateLlieten werden Tussen 1966 en
1969 een zestal KOSMOS satel lieten gelanceerd, uitgerust met appa-
ratuur om straling en bewolking waar te nemen. Deze werden opgevolgd
in 1971 door de METEOR satellieten die apparatuur bevatte gelijk aan
de Amerikaanse satellieten werkend volgens het APT systeem. Eveneens
in 1971 werd een Franse satelliet gelanceerd met de naam EOLE. Daar-
bij werden kort na de lancering, in Zuid Amerika 500 ballonnen opge-
laten, die op ongeveer 11 KM hoogte zwevende gehouden werden, omdat
de luchtdruk daar 200 mbar bedroeg. De EOLE satelliet op zijn beurt
bepaalde hun lokatie regelmatig en zo konden de winden op genoemde
hoogte worden gemeten. Ook vonden er temperatuurmetingen plaats, die
met alle andere gegevens verstuurd werden aan het volgstation.
..... wordt vervolgd. bron .: PA3BKW.

++ PA3ESF + THE WORLD LINK RTTY BULLETIN + URETERP + R14 + JO33CC ++

KWHR - HAWAII. Ruim een jaar geleden kwam het religieuze station
---------- KWHR voor het eerst in de ether. Op eerste Kerstdag
1993 nam het moederbedrijf LeSea Broadcasting een 100 KW sterke
zender in gebruik bij Naalehu, op het zuidelijkste punt van Hawaii.
De programma's van KWHR zijn identiek aan die van het station WHRI
uit de Amerikaanse staat Indiana en worden door middel van de Galaxy
satelliet vanuit de VS naar Hawaii overgestraald. De twee antennes
bij Naalehu- een dipool gordijnantenne en een log periodic staan
gericht op Azie en het Pacifisch gebied. Er zijn daarom in het afge-
lopen jaar niet zoveel gelegenheden geweest om de zender in Neder-
land of Belgie te beluisteren. Omdat KWHR het enige kortegolf
omroepstation op Hawaii is, blijft het de moeite waard om naar zijn
signalen te speuren. In het winterschema zijn twee van de vijf

frequenties voor ons van belang. Op 9930 kHz zendt KWHR uit tussen 04.00 en 16.00 uur UTC. Gezien de huidige propagatie-mogelijkheden, liggen de beste ontvangstkansen hier tussen ruwweg 09.00 en 14.00 uur UTC. Dat wil zeggen, tot ca.11.00 uur via het korte pad en vanaf ongeveer 13.00 via het lange pad. Op 13625 kHz zendt KWHR tussen 18.00 en 20.00 uur UTC en zouden de signalen ons theoretisch via het lange pad kunnen bereiken...
..... Bron .: Radio Amateur Magazine Nov.'94.

Radio Nederland Wereld Omroep. Het nieuwe zendschema van de Hilver-
---------- sumse Wereldomroep laat enkele op-
zienbarende veranderingen zien. Het meest opvallend is wel de introductie van een relaystation in Duitsland. In de praktijk bleek het zenderpark bij Zeewolde niet zo geschikt voor uitzendingen in de richting van Engeland. Radio Nederland besloot daarop om voor de Engelstalige uitzending tussen 11.30 en 13.25 uur UTC faciliteiten van onze oosterburen te huren. Daarbij wordt gebruik gemaakt van het zenderpark Nauen,in de voormalige DDR. Zo'n vijf jaar geleden waren deze zenders nog in gebruik bij de communistische Stimme der DDR. sinds eind september kunt u vanuit Nauen op 7130 kHz dagelijks Ginger da Silva, Harry Kliphuis, Marijke van der Meer en andere Wereldomroep-cotyfeeen horen. Ook opvallend is de introductie van de middengolf-frequentie 1386 kHz voor het avondprogramma tussen 20.00 en 23.30 uur UTC. De zender die de Wereldomroep hiervoor huurt,staat in Bolshakovo in de Russische enclave Kaliningrad. De indrukwekkende antenne is gemonteerd op twee parallel opgestelde rijen van elk vier masten. Deze zomer werd de zender in Bolshakovo al eens gehuurd, om wedstrijdverslagen van de wereldkampioenschappen voetbal te relay-
eren.

Crisis Joegoslavie:Frequentie's. Voor bezitters van een kortegolf
---------- (HF)-ontvanger plaats ik wat info ivm. de crisis in ex-Joegoslavie, dit heb ik al eerder losgelaten op de BBS, maar gezien de omstandigheden nu, wellicht interessant om te weten. Ondergetekende betreurt deze bloedige oorlog,in het land waar ik zelf in '89 en '90 vakantie had (Kroatie en Montenegro) ,een land met vriendelijke mensen, en waar nu vrouwen en kinderen op afschuwelijke manier worden afgeslacht, toch zo relatief dichtbij Nederland.

Op 5310 kHz kun je allerlei onderling communicatie verkeer waarnemen van Westerse landen die toezien op naleving van de zgn. handelsblokkade zoals scheepsbewegingen in de diverse gecontroleerde wateren. Ook grondradar en AWACS tref je hier aan. Verkeer tussen AWACS onderling vindt plaats op en rondom 6723 kHz. De AWACS Stijgen doorgaans op vanuit Gelsenkirchen en als callsign wordt vaak 'DHN66' gebruikt.Luister eens op 11270,5 en 6762,5 kHz. Ook heeft het nut op 6738 kHz te luisteren,hierop is militair vliegverkeer te horen dat zorg draagt voor aanvoer van humanitaire hulpgoederen. Datzelfde

geldt voor de volgende frequentie-gebieden .:

4725- 4745 kHz, 6730- 6750 kHz, 8965- 8995 kHz, 11175-11235 kHz,
13200-13260 kHz, 15000-15100 kHz, 17950-18020 kHzn 23220-23260 kHz.

(Mode is USB). Daarnaast is natuurlijk FleetSatcom satellietverkeer
te horen. Afhankelijk van de kwaliteit v/d antenne kan,vooral rond
het middaguur, communicatie waargenomen worden tussen 261.450 en
261.950 MHz.(N/FM-mode).

PERSBERICHTEN. Via de kortegolf maken ambassades over de hele
-------------- wereld contact met het Ministerie van Buitenlandse
Zaken in het land van oorsprong. Andersom worden ook (pers)berichten
naar die ambassades gezonden. Op diverse freq. zijn RTTY-berichten
te zien van 'DFZG'. De persberichten moeten met een korrel zout ge-
nomen worden, want het betreft doorgaans Servische propaganda.
Engelstalige persberichten worden de ether ingestuurd vanaf ca. 1430
u UTC Baudrate 75Bd. 9056, 11140, 13400, 18055, 20130 en 22890 kHz.
De uitzendingen beginnen met allerlei afkortingen en codes,zoals de
callsign. Dit wordt gedaan zodat de div. ambassades af kunnen
stemmen, en dit kan best een kwartier duren.Daarna volgen meestal
berichten. in de Servische taal en gecodeerde berichten voor diverse
ambassade personeel, meestal te herkennen aan een reeks letter- en
getallencodes. Daarna volgen dan de Engelstalige berichten. Stop
maar een flink pak papier in je printer, want een pagina of 50
berichten zijn geen uitzondering..

TANJUG. (Telegrafska Agencija Nova Jugoslavija) Dit bekende pers-
------- bureau heeft over de hele wereld haar persmuskieten zitten,
en zendt dan ook berichten van allerlei aard uit, en wat niet wense-
lijk is, uiteraard NIET). Je zou het zo niet zeggen van een int.
persbureau,maar de spelling en grammatica van Engelstalige berichten
is vaak allerbelabberst. Er is dus niets aan de hand met uw decoder.
De callsigns beginnen met YZD of YZJ en de Baudrate is 50.

7658 kHz (24 uur p/d) 7806 kHz (1700-0400) 7996 kHz (1700-0400)
11604 kHz (0400-1700) 13440 kHz (0400-1700)

DIVERSE STATIONS. Populair voor berichten vanuit Joegoslavie is de
----------------- 40 Meter-Amateurband (7.0-7.1MHz). Hoewel het
onderste stukje van 40 kHz bedoeld is voor CW, kom je hier vaak
Joegoslavische stations tegen in 'phone'. Daarnaast vindt net onder
de amateurbanden veel communicatie plaats, niet alleen van en naar
zendamateurs, maar ook tussen militaire groeperingen. Het laat zich
raden, dat men geen uren op dezelfde freq. blijft 'hangen'. Draai de
freq. eens af vanaf p/m 6930-7100 kHz. USB/LSB worden beide gebruikt
Verder zijn er nog legale en niet-geregistreerde radio-stations (AM)
te vinden tussen 6200-6300 kHz. Radio Bosnia-Herzegovina tref je aan
op en rondom 6218 kHz. Hoor je in dit gebied iets,wil dat nog niet

meteen zeggen,dat het een radio-station is,het eerste 30 kHz stukje wordt nl. ook gebruikt in de scheepvaart (phone). Radio Zagreb (Kroatie), vaak gestoord door Serviers, en derhalve vaak van freq. gewisseld, vindt je op 13830 kHz en is het best te beluisteren tussen 2000-2230 uur UTC. Radio YUGASLAVIA zendt uit op 11870, 17740 en 21605 kHz.
..... Bron .: CB packet-net van NL1MNS @ RY1BBS.OV.NLD uit Meppel.

STROOM (17) Allessandro Volta. De elektriseermachines zouden zeker
------------------------------ steeds groter zijn geworden, de Leidse flessen steeds verder zijn verbeterd, wanneer niet tegen het eind van de achttiende eeuw een nog veel beter idee was geboren in het brein van Allessandro Volta, een Italiaan dit keer, de uitvinder van het elektrisch element en daarmee de grondlegger van 'de batterij'. Volta was een zorgenkind. Op zijn vierde kon hij nog niet praten. Maar hij haalde die achterstand ruimschoots in. Wat hij eerst helemaal niet kon, deed hij later vlot in vijf talen waaronder Nerderlands. Zo kon hij, eenmaal gegrepen door de wonderen van de elektriciteit - toen de grote rage in Europa -, corresponderen met onderzoekers in andere landen. Hij was achttien toen hij al in een geschrift probeerde aan te tonen dat de zwaartekracht uit de elektriciteit verklaard kon worden. Maar hij was ook praktisch.
Hij bedacht een elektrisch pistool waarmee hij moerasgas, dat hij opving in het meer van Como, tot ontpolffing kon brengen.Hij opperde ook in 1777 de mogelijkheid om langs houten palen een draadverbinding te maken tussen Como en Milaan, een afstand van vijftig kilometer. Langs die draad zou dan een stroomstoot kunnen gaan die bij aankomst in Milaan het elektrische pistool vanzelf zou doen afgaan. (Hoe lang het zou duren voordat de stroom daar was, wist toen nog niemand). Zijn element bedacht hij in 1880. Hij ontdekte dat er elektrische spanning ontstond wanneer twee stukken van verschillend metaal in een zoutoplossing werden gedompeld, zonder dat er verder nog enige spierkracht aan te pas kwam. Hij ontdekte ook dat men zoveel bakken achter elkaar, of op elkaar - de Zuil van Volta werd dat genoemd - kon plaatsen als men wou, en dat de spanning hoger werd naarmate het aantal bakken toenam. Het eind was zoek. Hij ging met zijn toestel op reis door West-Europa, een hele onderneming in die tijd - hij had zesentwintig dagen nodig om van Pavia, waar hij professor was geworden, naar Parijs te komen -. Maar daar werd zijn moeite danig beloond. Zoals alle geleerden in die dagen, als kermisgasten bijna, hun kunst aan vorsten en adellijke lieden vertoonden, was ook Volta met zijn Zuil een sensatie, waar hij maar kwam.
Napoleon had allang begrepen dat de elektriciteit grote mogelijkheden in zich borg en maakte Volta graaf nadat hij de batterij met eigen ogen had gezien. Hij was zo onder de indruk van de vinding,dat hij twee jaar later nog, toen hij in de Nationale Bibliotheek in Parijs kwam, van een opschrift ter ere van Voltaire onmiddellijk de laatste drie letters liet wegslaan, zodat er kwam te staan, Au Grand Volta. Como, de geboorteplaats van Volta, eerde hem op zijn honderd-

ste sterfdag in 1927 met een marmeren graftempel in griekse stijl. Maar een onverwoestbaar monument had Volta al eerder gekregen. In 1881 werd op het Internationale Elektrisch Congres in Parijs zijn naam voorgoed vastgelegd in alle talen als 'de eenheid van elektrische spanning'.

FRAG. Friese Radio Amateur Groep te Leeuwarden houdt a.s. zaterdag
----- 10 december in het FRAG Club gebouw aan de Brandmeer 47a in Bilgaard te Leeuwarden een vlooienmarkt. Alles op het gebied van de hobby is er te vinden zo melde onze correspondent ter plaatse, Ljibbe, PA3FPE. U bent vanaf 10.00 uur tot 16.00 uur van harte welkom.. in het FRAG club gebouw....

TE KOOP. Meerdere keren kwam er bij de redaktie een verzoek binnen
-------- om in dit bulletin een rubriek op te nemen van het een of ander te koop aangeboden. Daar wilde ik het toch even over hebben... Berichten voor te koop of gevraagd, kunnen worden doorgegven aan de colega ronde leiders van het Hunnebednet te Assen (regiowinkel) of aan de Muntronde leiders (Muntwinkel). Voor de regiowinkel van het Hunnebednet kunt U dat doen aan Michel, PE1OZA via telefoon.nr.: 05929 1542 Ma t/m Vr 18:00 - 21:00. Voor de Muntwinkel kunt U Uw aanbiedingen doorgeven tijdens de Muntronde op de repeater van Akrum op 145.700 Mhz (20.00 uur op Zondag) of telefonisch via het tijdens deze ronde genoemd telefoon nummer. Waarbij gesteld dat aanbiedingen niet van commerciele aard mogen zijn en,let U daar vooral op als het zendaparatuur betreft, dit enkel en alleen mag worden verkocht aan daarvoor bevoegde personen (gelicenseerde zendamateurs). Dit ter voorkoming van oneigelijk gebruik op de amateurbanden.. (piraterij). Zie daarvoor ook de bepalingen in de machtigingsvoorwaarden o.a. het bijhouden van een register voor het in bezit, danwel verkocht hebben van de aparatuur..... Bij niet nakomen van deze bepaling volgt voor de zendamateur een boete van 500,= en voor handelaren is dit 2500,=. Zie voor meer info ook de publikatie van de HDTP t.a.v. het sanctiebeleid.... Maar buiten deze zaken.... is het zowiezo ook voor Uw collega zendamateurs prettig te weten dat ze gevrijwaard blijven van gestoor op de amateurbanden van lieden die hiervoor geen toestemming hebben ontvangen van de HDTP en/of omdat er weer eens een collega 'amateur' meer zag in harde valuta dan in sociaal collegiaal gedrag. 't is maar even dat U dit weet..... Weit, PA3ESF.

TENSLOTTE. hebben wij U nog mede te delen dat wij volgende week er
---------- natuurlijk weer zijn.. Dat er op dit monent leuke SWL info wordt aangeleverd uit alle hoeken van Nederland.. Dat ik graag zie dat dit ook zo doorgaat... Dat U hier via het bulletin weer Uw voordeel mee kunt doen.. Dat ik dat weer heel plezierig vindt.. En ik dan ook vraag aan al die informanten... BLIJFT U A.U.B. DOORGAAN MET DIE MOOIE INFO.... En..... als U dat nog niet deed.. dit kunt sturen aan Weit, PA3ESF via PI8FWD, of CB1WLU via DR1BBS of via

Internet aan CB1WLU@CBPACKHV.XS4ALL.NL ... Maar U kunt het ook heel gewoon doen via Bouekers 40, 9247AR te Ureterp.... of U belt even met mij net als U dat vanavond voor het inmelden nog kunt doen via tel .: (0)5125 27 02 ... Voor de zendamateurs gaan wij nu QSY naar 145.325 Mhz en ik hoop U volgende week weer aan te mogen treffen op deze qrg... Prettige avond verders... en doe St.Klaas de groeten van mij..... 73' Weit, PA3ESF.

: expanding and attracting lots of technically qualified young people is that
: computers offer so much more challenge with so much less hassle...

: In the last 15 years I have seen all the technically talented people in ham
: radio loose interest in favor of learning about computers... We have
: applied this computer interest in some ways to ham radio... But because of
: regulations restricting development in this technically expanding society,
: it has stagnated... Ham Radio cannot expect to be at the forefront of
: technology, as it has been in the past, with technical restrictions... We
: were about to have one of the best private message forwarding systems ever
: seen, until the BBS restrictions were imposed... Hams, being the
: by-the-rules kind of players they are, backed off...

: Obviously this is a simplistic approach but it's a starting point... And,
: yes, I am aware that there are lots of problems... But, on this first day
: of the year 1995, lets make a fresh start with Amateur Radio... Lets get
: the ball rolling for some significant changes here... Let's put some snap
: back into Amateur Radio... Let's let people use Amateur Radio as a
: technical building block and personal radio service it was designed to
: be... Amateur Radio is a national treasure that is dying... Let's do
: something for Ham Radio...

: I'm going to do my share... I'm going to turn this into a full blown
: article and get it published in some rag... Even old Wayne's rag if
: necessary... My New Year's resolution...!!!

: Next...!!!

Marv,
I am one of those computer types that finds the legalistic challenges of
dabbling in Ham radio just a little more than challenging! And for
what? I have made a few inquiries on these Ham newsgroups regarding the
desire for Hams to have full Internet access over Packet, but it seems
that there is too much beauracracy and nit picking rules to even
contemplate such initiatives.
It is challenging enough to think of devoting volunteer time (I am just
at the beginning of my career track and extra time is precious) and possibly

personally donated computing resources to such an endeavor, just to be locked out by bureaucratic minutiae.
There will have to be a lot of changes to attract people such as myself. I see no need for code at all. Even those of the "traditional ham generation" (no offense intended) who did not learn code when they were young are many times denied this hobby of their peers by the code requirements. I feel that the Ham radio community is losing it's sense of purpose and needs progressive people such as yourself to open it up and re-vitalized it.
djs.
P.S. It won't take but one irresistable offer by a commerical company for all that marginally used bandwidth for the FCC to let those Ham bands go!

>industry.
>
In some respects it is. The catch is that landline modem technology is
of limited use on a shared radio channel because it relies on the modems
at each end runing through a training sequence. If you tacked such a
training sequence on each packet then your throughput would probably be
a lot worse than a 1200baud radio modem. The signal-to-noise ratio
required is also quite high - the average phone line is capable of
having the noise floor more than 50dB below peak signal - try getting
50dB on some of the radio links in use!

A landline modem would probably work OK on a full-duplex backbone link
because the two ends could train up once and hopefully hold the link
forever. Failing that, using simple FSK you are into a direct
relationship between bandwidth and bits/s

I almost put that point in my original post... I am personally in favor of
increasing the technical difficulty of the written test... I would like to
return the ham bands to the experimenters who pioneered them in the
beginning... (But still 5 wpm max CW speed test for all...)

> If this sounds like your bag, by all means an amateur

Agreed... My first job was with Collins Radio Co... After a day long
interview in which ham radio was a major topic of discussion, I arrived
back home to my first job offer...

32. Packet Repeater Coordination

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-03 02:51:10 UTC
From: "Harvey, Nels" <NHAR@MUSIC.LIB.MATC.EDU>
Message-ID: <02JAN95.23601075.0023@ESAMATC.LIB.MATC.EDU>
Source record: 45515
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.policy

I have noted some discussion of the use of Voice Repeater frequencies for Packet repeaters. As Vice President of the Mid-America Coordination Council (MACC), I would like to point out that we have given reasonable consideration of the need for Packet repeaters, to provide efficient throughput. MACC is the umbrella coordination group for over 20 state and local repeater coordination groups.

In essence, it has been determined that Packet and voice repeaters are generally not compatible. MACC has a basic bandplan providing for Packet from 446.025 MHz. to 446.200 MHz. simplex, and duplex pairs of 441.025/446.025, 441.050/446.050, and 441.075/ 446.075 MHz. These are chosen to provide frequencies in the 440 MHz. range to Packet interests without a need for coordination with the voice repeater coordinators, and to protect unpublished repeater control and audio links. These frequencies, along with the 430 MHz. frequencies that are harder to get some radios to work on, provide the Packet users with a reasonable number of frequencies for most Packet applications, I believe.

The point is, we do wish to work closely with Packet organizations, because we are using the same limited resourse. I believe our plan is reasonable, easy to use, and places voice repeaters at a minimum risk. If further frequencies are needed, discussions with MACC are welcomed. Our Annual Meeting is at the Dayton Hamvention each year. The members are in the Repeater Directory.

Coordination is a way of life in Amateur Radio. We don't really need any range wars like the ones in the 70's any more. MACC, TMARC, SERA, TSARC and others are umbrella organizations that offer support and a measure of authority for our Coordination Warriors. We all need to hear from the Packet community with your frequency needs. I hate those re-tries as much as anyone else. Together, we can minimize interference, and further this great hobby to greater heights!

Very well put, as were the rest of Marv's comments. I sometimes wonder if I would ever have become a ham at all if I hadn't done it early in high school, just before I discovered computers.

As for Marv's comments about streamlining the service, I'm not sure that even they go far enough. I find myself occasionally toying with the idea of just turning all of the ham bands over to Part 15 or something like it. Just a few basic technical rules to promote optimum spectral efficiency -- no prohibitions on business use or anything else.

At least that might serve some public interest.

Phil

Nels,

Here in Seattle, WA we have a 9600 bps repeater at 146.980 MHz and a voice repeater at 146.960 MHz. Never have any interference problems here. I think just good sound technical practice will allow the two to co-exhist. Also we have 3 -440 MHz 9600 bps packet repeaters too, all are within the " voice " repeater freqquency range. We are right next to some voice repeaters there too and no trouble. Now the deviation is set to 3 KHz, not 5 or 7 but 3 KHz and all works quite nicely.

First, I know this subject has been beaten to death... but...

I am currently running Baycom v1.5 software and was wondering what the current release is up to... and where I might find a FTP site to get it from.

Also, does anyone know of a driver for the Baycom (Baypac) modem which will allow the use of a standard terminal program (e.g., Procomm Plus) instead of the kludgy Baycom software?

Thanks! Steve N9VAH

43. Basic Packet Station Advice

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-03 20:55:11 UTC
From: afn02512@usenet.freenet.ufl.edu
Message-ID: <3ecdjf$rag@freenet3.freenet.ufl.edu>
Source record: 45532

I want to get into packet but am on a tight budget. So far I
have a VT100 terminal and an Alinco DJ160 HT. I need a TNC
to complete the station but have the following concerns:

o Is a Terminal-TNC-HT packet station really practical?
Can I really do anything without a computer?

o What TNCs should I consider and what are prices new
and used?

Any comments will be appreciated. Please respond via E-mail.

From: rick_whiting@atk.com
Message-ID: <1995Jan3.213522.2411@omega.atk.com>
Source record: 45526

I'd like to set up my Icom IC-R7000 receiver to monitor 9600 Bd packet (with G3RUH-type modem). Anyone worked out the AF connection and tried it out? Looking at the schematic it appears that the connection should be to the output of the FM-N FM detector feeding Q13/Q14, e.g., the junction of R97/R99. Any suggestions before I start "hacking" will be appreciated!

Doesn't the V.34 spec include provision for half duplex operation? Hopefully when V.34 modems become plentiful and cheap like v.32bis did....we can try it out. Of course I paid over $1000 for each of my v.32bis modems (the first two anyways).

>
Not having my manual handy or my KPC3, I can't tell you exactly where....but
there is a pot for adjusting the audio drive level....there's also a jumper to
select the range that the pot will vary over.

I also don't remember which way to turn it. But, I had to tweak mine down
a little bit too....

If I remember the pot is exactly where the manual said it would be.

Let's consider the plight of a "codeless tech":

It *is* illegal for the codeless tech to set up and operate his own VHF to HF gateway, since he has no authority to be the control operator of an HF station.

It is *perfectly legal* for that same ham to use someone else's VHF to HF gateway. This is because the codeless tech is only transmitting on a frequency where he does have authorization. The person who runs the gateway is acting as control operator for the HF station.

I tried a NIR-10 on EME with a custom 30,60 and 120Hz filter. It produced
pulses like ignition noise for each dit and dah. A filter that narrow
shouldn't produce any pulses at all. I also didn't find it much help
for strong signal HF CW either on the wider settings (100, 250, 500? Hz).

FYI, if you want to you can get a cable from MFJ that will go from the KPC-3 to a Yaesu/Icom radio. Works fine on an HTX-202. Cost is nominal. HRO carries them if you want to go that route.

51. [HELP WANTED] TCP/IP via X1J Net/ROM

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-04 02:43:00 UTC
From: scotte@ccs.neu.edu
Message-ID: <3ed1vk$hh0@narnia.ccs.neu.edu>
Source record: 45397

I am looking for a working autoexec.nos/autoexec.net program to let me
play TCP/IP through a local X1J Net/ROM node.

My IP address and domain name are already in the chip.

The info is as follows:

My IP: 44.56.17.10

My Domain name: wy1z-1.ampr.org

Net/ROM IP: 44.56.17.2

Switch IP: 44.56.17.1

Switch domain name: net.wg1i.ampr.org

Should the AX25 name be wy1z-1?

I am using JNOS 110H (precompiled 8088 version).

Please send your autoexec.nos/net files to me, preconfigured!

Thanks!

P.S. In return, I'll place a copy on oak.oakland.edu:/pub/hamradio
for others to copy if they need.

It would also be nice for a clean, working, normal autoexec.nos/net file
to be sent to me as a template for others to use (which I would also
place on oak.oakland.edu).

73,

This action seems to discriminate against digital modes. When was the
last time the groups on 20 meters insisted on authentication?? Is the
FCC still protecting ATT/Baby Bells/Other Rich Companies from the
threat of competition from hams? For a 'service' that supposedly is
to advance the state of the art, our hands sure get tied alot. This
is the kind of cr*p that caused me to drop ham radio during the Gulf
War. Now that I was thinking of returning, I see that nothing has
changed....N6VUW...maybe.

In Canada, and this may be a requirement in the US, that *control* operator
must be in 100% attendance when this occurs (no different to him handing
the mic over to a non-licenced individual, he must be ready to hit the big
red switch at all times).

When we queried the DOC (now Industry Canada) about this, their ruling was to
actually make VHF/HF (normally unattended) automated Gateways illegal rather
than force the control operator to be in 100% attendance. The result has been
that in our community, no more gateways exist, and all HF and VHF messaging is
now handled by a, HF inaccessible to the VHF port, BBS system to simply relay
the traffic. Since the rules in the US are far more stricter, I'd say that yes,
HF gateways are illegal, if one should *ask* for an official response ...

Assuming you are talking about ham radio ...

There are a whole bunch of them ... scattered about the network
at various locations around Portland.

What is your qth, and where have you checked in the network?

If you are talking about telephone links, then I have no idea.
This is a ham radio forum, you might find telephone dialup info
in other newsgroups.

>frequency where he does have authorization. The person who runs the
>gateway is acting as control operator for the HF station.

Keep in mind, Bob, that unattended HF packet operation is not
currently legal. So, sure, a Technician can make use of a VHF to HF
packet gateway, as you point out, but there *must* be control operator
present. The control operator must be present *not* because a Tech
is using the gateway, but because the gateway can not be automatically
controlled.

However, when 10m is in, you'll often hear Techs using VHF/UHF to HF
"gateways" on 10m FM. As long as the trustee of the 10m link is properly
licensed, automatic control may be used, obviating the requirement for
a control operator, per se.

In the near future, when unattended HF packet is made legal for the masses
(rather than those under the STA), then Techs should be able to use automatically
controlled HF packet gateways, whether there is a control op there or not.

Really letting that megalomania get out of hand, huh?

|>... muphaus@cris.com (Marv Uphaus) writes:
|> Most of us old guys who really loved ham radio when we were kids
|> are still here primarily because we are still trying to rekindle
|> that wonderful feeling of awe and amazement we had the first time
|> we made a contact on the radio from our bedroom...

I can understand being overcome by ennui if you work with packet much. Sharing a not-even-1200 baud channel with a few hundred close friends while people winge that the packet network hasn't been turned into another internet can take a lot out of anyone.

Is ham radio really just a bunch of guys with too much money to back up their nostalgia? I think not. Not all of us became hams in high school. Certainly I didn't get into it until I was in my mid-thirties. I know many more who have the same experience.

The thrill I get out of ham radio isn't nostalgia. It's right-now. It's 1995 and counting. I talked to someone in Paris the other day while sitting in my cellar turning 100 watts on and off. If I stuck a 100 watt light bulb out the window and clicked it on and off, would I expect someone in Paris to notice the glow? No. But 100 watts of RF zips around the planet and weak-as-a-lamb touches Paris where someone can pick it out of the air and turn it into an audible signal.

I talked to a guy half a continent away on a tiny box that I built with my own two thick, clumsy hands. Eight screaming watts of SSB radiating from a wire slung over the rafters in my attic and we could exchange scratchy greetings in cellars hundreds of miles apart.

And when the contest is on... yow! It's like driving 75 mph in rush hour traffic only you can get a snack whenever you like. All pushing and shoving and "he's got to call me next because I *deserve* this contact!" When it's over I'm all wrung out and excited and I feel like I can hear a whispered conversation 100 feet away.

How about the feeling of teaching a segment of a ham class? When you demonstrate something that was just theory up to that point and you can see the connections being made?

Working the satellites, MIR.... a near-miss on THE SHUTTLE! My aged heart goes pitter-pat with in-the-present excitement.

There are days (usually just before it rains) when the despair settles in and all of life -- let alone ham radio -- seems pointless and empty. But the sun comes out, I shake it off and go on. I've had other hobbies, they've paled and I've moved on to the next thing.

Life is more closely modeled by fuzzy logic than Boolean. There is a continuum of answers all broadly correct no one of which we must all subscribe to. Maybe ham radio has become empty for you and it's time to do something else to re-energize yourself. That's OK. But remember that to many of us it's still active and vibrant and fun. Don't write it off on our behalf.

68. Re: FCC denies Karn's petition - Warning: FLAME

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-04 23:21:39 UTC
From: waf@sunfish.zk3.dec.com
Message-ID: <WAF.95Jan4182139@sunfish.zk3.dec.com>
Source record: 45399

I'm not replying to any particular message since there is no
one person to whom my comments are directed. If that prevented your
kill of what you found to be a boring discussion from wiping this
post, I'm sorry.

What a bunch of whining ninnies. You can't get your way
without working for it, so you forcast the death of Amateur Radio
(granted, elimination of the code requirement dealt it a mighty blow,
but it still seems to be standing). The FCC has taken an intractable
issue and made it subject to technical solutions, and you complain.

You always were responsible for the content of the messages
you forwarded, that's not new. Those guys on 20m SSB or who are doing
CW for the TCC also were, and continue to be, responsible for the
content of the messages that they forward. But they're aware of the
content by virtue of their mode, and so can censor the unacceptable.

But it's a pretty severe burden for automatic digital
forwarders, so the FCC takes pity on you. They say that the digital
guys can pass the buck to the originating station by having the
forwarders authenticate where the message came from (even if part of
the path is over the internet), a purely technical, computer oriented,
technical challange. Do you thank them? No, apparently the technical
challanges you want to solve are of the form of how to avoid paying
for an internet account and second phone line, so that while your
daughter is talking to her friends you can still read alt.sex.bondage
and post your advertisement for commercial products like ham oriented
CDROMs.

I guess that I'll write to the veep lest he think that you
guys speak for every ham. If there's a "silent majority" out there
(though I expect that most such have been offended away from this
newsgroup by now), I suggest that you do the same.

We may disagree, but I still mean the 73 below.

>|> So what's the next step Phil? Any suggestions?
>
>Not really. The Internet has already subsumed just about everything
>that was interesting about ham radio. And Part 15 will take what's
>left.

<stuff deleted>

I'm getting very enthusiastic about video teleconferencing via wideband
digital communications. I have played with the CuSeeMe software on
486/33 PC,and found that I could look at mostly acceptable talking
head pictures via a 14.4K modem. With 100-250 Kbps, I expect that
we could put a video/audio network with eight participants visible
on the screen.

This stuff might be the "killer application" that would get the average
ham to run out a buy a 900/1200/2400 MHz station. That has a number of
significant benefits.

- lock in our access to the band
- get ham radio back into technology development
- develop applications with significant commercial interest

We need to expand beyond thinking of digital communications as email.
Consider the following applications (each available as shareware for PC's
on the internet)...

- digital voice mail
- electronic blackboard, two people squiggle at once
- video teleconferencing
- picture and movie exchange

I really like the idea of using high speed digital to support new modes
of person to person communication within the range of the radio system.
Packet email is a powerful and unique capability, but it doesn't have the
same "feel" as talking to someone (or seeing someone, or exchanging
squiggles on the screen with someone...)

My basic technical approach goes as follows

- Digital repeater on 900/1200/2400 takes in packets
from TDMA users and broadcasts them back
- Cross band repeating may simplify duplexing

- Users use fixed high gain antenna pointing at repeater
- High end users receive transmit timing instructions from the central repeater (eliminates CSMA/CD problems)
- Support low end receive only users with AX.25 packet radio keyboard command and control input (1200/9600 baud). This supports write mostly apps such as news reading and WWW.
- Modify applications protocols slightly to broadcast UDP's and avoid retransmitting digital video to each user.

I have more ideas on this subject if you're interested. But I certainly haven't thought out all the issues. Suggestions and help would be appreciated

Care to clarify that Hank?? Why would it be any different than all the
2M/10M cross-band voice repeaters that have been in operation for years.
Standard 3rd party rules apply, but in the case of voice repeaters, I've
never heard of anyone being cited even for violations of those. I have
heard lots of DX contacts done cross-band on 2M/10M FM with countries that
do not have 3rd party agreements with the US. I have never, not once,
heard of any complaint about it. Just what would make packet any different??

71. Help -- APRS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-05 02:51:36 UTC
From: jeffw2302@aol.com
Message-ID: <3efmro$c74@newsbf02.news.aol.com>
Source record: 45410

Hello all-

I have been having problems with APRS one of the locals here(Will)
has gotten into APRS and he passed it to me, when I loaded it, It loaded
fine, I entered my call, COM Port, and my Location etc...etc...

Will and myself get on a quite Packet Frequency, both running APRS,
We both were Beaconing fine, and he was seeing my little "House" icon on
his screen, and I can see him transmitting, but, I can't see him on my
screen, He uses this APRS on 30m. And it works fine, but it won't work
when we try it.. Any ideas of how we can get this working? Oh, I was
thinking maybe that program when we transfered it got some kind of error
during the transfer, so I called a BBS in the Northern USA, and got the
same file, and I still have the problem. Thanks in Advance for your help.

: bill KB3YV

In fact, I am under the assumption that rebroadcast stations, ie
repeaters, nodes, digipeaters, etc, also fall under the "control
operator" requirements. I think it is naive to think that for every
station that can rebroadcast a signal, whether it be across bands or in
the same band, they are all in *total* control at all times. I always
believe that a person should be responsible for their own actions. Most
rebroadcast stations are set up for the express purpose of providing a
benefit to a number of people, not just the individual who set it up. For
all this time, effort and money spent in providing this service, is this
what is comes down to: The Sysop must monitor *ALL* traffic through the
station at all times or shut it off.?? Sort of defeats the purpose of
many of these stations. For me, as a sysop of a VHF<>UHF<>HF gateway, I
realize it is my responsibility to try to ensure the gateway is not used
illegally but I also feel that the bulk of the burden be placed on the
originating station. For example, if station A sends a pornographic
message or commercial message through my gateway, station A should be
held accountable, not me. If I continue to allow that type of traffic to
go through, sure, then it's my hide. It seems to me that it is another
case of the Gov't forcing automobile manufacturers to add safety features
to cars so *idiots* won't get hurt when they drive drunk instead of
keeping the drunks away from vehicles. As far as I'm concerned, until IC
tells me that the gateway is illegal, it will continue to operate so as

to provide a link from our Island to the rest of the World (and vice versa) for the Amateur population. I'm quite sure it isn't the only one from what I see in it's heard list.

Hi Ken,

At this point I don't beleive there is an internet <-> packet gateway
in the Portland area at all. As far as I know, the greater Portland
area folks are still dependent on the gateway here in the Seattle area
for connectivity to internet, and considering how many hops are
involved, I doubt connecting to a packet BBS via the that path would
work very well.

The Tek radios are around $100 but they are also 1 or 2 watts or
something like that. If you need higher power, you can usually find used
Motorola UHF Moxies for around $40. You buy a set of crystals, retune
them and you end up with something like 15-25 watts and very little work.

Seems like the best way to go, at least for nodes, links, or anything
fixed frequency.

Everyone's always talking about getting used motorola and GE radios cheaply and getting them going on 9600b. Is there a source for these radios that I don't know about. There are SO many different types of these radios out there. Low Band, High Band, Micor, Motrek, Motrak, Master, Master II, MVP, Custom MVP, etc. I'd like to pick up 5 or 6 rigs (for the local TCP/IP group) but I don't know which rig to look for, or where to look.
Yesterday, I saw a GE Custom MVP (I think that was it) that was about the size of a lunch box. All the other GE rigs I've ever seen (and Motorolla too) have been the briefcase/boat-anchor type. What's the difference between the 'lunchbox' size rigs and the briefcase size rigs? If someone could tell me the 'right' rig to look for and where to find them, (a phone number perhaps) I'd really appreciate it. It would really be nice if someone would document this stuff someplace. Thanks.

Yes and Yes
Node hopping and keyboard to keyboard QSOs are very practical. Logging into a Packet BBS and reading and sending messages works well too.

>
> o What TNCs should I consider and what are prices new
> and used?

My recomendation would be a KPC-3 from Kantronics. I use one and love it. They list for about $130, can be easily found for $115, Ocasionally as low as $105 and I saw a used one asking $90 + shipping. My guess is that used ones would be rare.

In article <Lk0Fyc2w165w@lynx.mn.org> dave@lynx.mn.org (David L. Messer) writes:
>Are there any handhelds that have a built-in connection for 9600 baud (or
>higher) use? Or, are there any brands that are easily modifiable?

The short answer is no. The longer answer is that you'll be better off
buying a Tekk data radio from the start. It'll cost less than a HT,
is smaller than most HTs, and will work at 9600 right out of the box.
Or, if you don't have to have very small size, then you'll be better off
with a larger crystal controlled mobile or base radio that you can easily
modify to operate 9600 baud.

To get a voice grade HT to work reliably at 9600 baud requires difficult,
and often very elaborate, modifications. Unless you *really* want to learn
SMD rework on an expensive handheld, and unless you have ready access to
SMD parts, including filters, varactors, chip caps, and resistors, I'd
suggest using voice grade HTs only for voice or 1200 baud packet.

The IF filters are generally too narrow and non-linear in phase response
across their passbands. The receiver recovery time is usually way too long.
And the PLL error loop filter response is generally too fast for good eye
patterns. Add to that the poor IMD response, and low power of a HT, and it
makes a terrible choice for a data radio.

87. HF Gateway Experience

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-05 14:59:54 UTC
From: sww@csuohio.edu
Message-ID: <1995Jan5.145954.13801@news.csuohio.edu>
Source record: 45415

I ran a HF gate between two and 10 meters for a time. The experience was enlightening. What I found was that the people who had never operated HF were (for virtually every operator) __**COMPLETELY**__ clueless as to what was going on.

The band would be wide open to South America. A heard list showed that numerous SA stations were currently being heard. A VHF operator would get on and attempt connects to Europe which may not have been heard for days. I would get on two FM and explain things. However, a couple of days later, there would be another operator, then another, then another. I kept explaining and explaining and explaining. This was working OK until a HF station entered the VHF net. All the explaining went to beans and everyone tried to connect to the HF station regardless of what was being heard. Back to square one.

VHF operators need to get aquainted to HF in ways that offer better feedback than a Gate does.

Now ... let's look at the HF port. Imagine being in a QSO with a station which is constantly held up by VHF operators from another gate trying goofy connects. The VHF operators tend to be aggressive ... they will try and try and try. Eventually the gate's callsign is considered a LID due to the problems caused on HF by their users.

HF to VHF works fine. VHF to HF will just degrade the HF net for everyone else.

If you have an interest in receiving real-time images from satelites
read on......

Equipment to receive these real-time images are manufactured in Queensland
Australia. This project began life as a research / recreational hobby by
a team of radio enthusists. The final outcome of the project was a system
to receive real-time images from polar orbiting weather satlites.

Images are available from American (NOAA), Russian (METEOR) and Chinese
(FENG-YUN) satelites as they traverse your geographical area. The
satelites transmit both visible light and infra-red images. Resolutions
vary from 2.4Kms to 5Kms per pixel.

The system comprises a simple omni-directional antenna, a suitable radio
receiver, demodulator card (AD converter) and viewing software suitable
for the viewing and manipulating images on IBM PCs.

An overall system price is in the order of $650 (Aust) with the possible
addition of a mast head pre-amp for $30. Various antenna equipment and
cabling is required and can be purchased for around $15. Detailed
diagrams are included for the construction of the antenna.

Please respond in e-mail if you are interested in obtaining more
information. Parts of the system are also available in kit form.

89. TCM 3105 with 2400 baud?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-05 16:10:51 UTC
From: qed@cs.tu-berlin.de
Message-ID: <3eh5mb$ng4@news.cs.tu-berlin.de>
Source record: 45429

I remember that a few months ago there was a thread about whether and how it is possible to use the TCM 3105 outside its specification with 2400 baud. Unfortunately at that time I was not interested in the subject, but now have a pair of these chips and would like to use them for that purpose... (I can use a quite broadband tv audio channel.)

Can somebody please tell me, whether it is possible to use the TCM 3105 at that higher speed and how this can be done? (I have the data sheet. Do you just double the crystal's frequency?)

Thank you very much!

91. Need help with NOS please please please please

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-05 17:56:05 UTC
From: jeffw@mxim.COM
Message-ID: <199501051756.JAA18719@macs.mxim.com>
Source record: 45417

I have been trying with no success to get any responce from the tcp-group
to get some brief help with KA9Q NOS (including beseeching help from Phil)
with absolutely no response. Frankly, it has been kind of frustrating. Well,
I am a ham and should have posted this here. So, here I go AGAIN.....

I have KA9Q NOS with the PA0GRI fixes v. 2.0p on top of ver. 12_29. I have had
a heck of a time getting ftp connections to proceed beyond the initial connect
message for ftp. In fact, the whole thing is balky. It will just branch then
hang. I probably have some timing stuff wrong in the autoexec.nos file, but
I'll be darned if I can tell what it all should be. I have been attempting this
for 2+ years and each effort kind of fizzles out at this point.

What I want to do with NOS but can't:

Net/Rom connects to BBSs: done. works great with
closest bbs, but if I go beyond that it is like kicking a square ball.

FTP: never get beyond the connect phase

Telnet: get a bit further, than hang

Mail forwarding: not yet, nope

And the most important one: Decipher the manual. Don't flame me, I'm sure it's all my
fault, but I just don't get it....

I would like to get beyond this level with NOS so I could do some more with it.
I could use about an hour of phone help (my quarter, gladly)... Don't care what
time, etc. I'll make it happen. I'll keep posting this every few weeks till
I get somewhere.... I notice a lot of other guys kind of at this level and I
RARELY see responses. Come on, guys, step up to the line. I'll help out other
folks when I get my bugs solved. I'd be delighted to pass on my knowledge once
I have some.....

Thanks very much. Sorry if this seems like a lecture.... I'm quite frustrated
at this time. I really need an expert... 73s n7ttq

Message-ID: <199501051901.LAA23232@macs.mxim.com>
Source record: 45419

Well, I griped about nobody responding to my requests, so I'd better put
my money where my mouth is. I am a packet station, and I am in Portland, OR.

My packet address is: n7ttq@k7iqi.ca.usa.noam

There are tons of packet nodes here. W0rli lives here. Other packet
nodes are: npdx, pdx7, k7iqi, sixbox, wlinn, kcybbs, etc.etc.
What I can't find here are people on packet using TCP who I can get a hold of
to help me, but that may change.

Feel free to contact me at any time.....

I just got off the telephone with Johnathon (one of the engineers who
designed the DGR-115) and he gave me some tech specs. They're using
FH SS in the 902-928 band; Receive sensitivity is -110 dBm for a 75%
packet rate (which comes out to about 10**-5 BER). They have internal
controllers that do TNC-like functions -- it looks to the end-user
just like a serial cable. It can do 115 kbps half-duplex with about a
20k back-channel. It can EASILY (emphasis his) handle 38.4kbps full
duplex all day long. They're working on a software update to do
point-to-multipoint operation.

He set one of the modems on a nearby mountain, and went out in his
light plane, and was able to perform reliable high-speed
communications while 85 miles away. This was using the stock whip
antennas one inside a building, the other inside a metal-skin
aircraft.

The bad news: They cost $1,250 per end. I assume that includes the
whip antenna and power supply. They also have part-15 cert for a few
different antennas - including a mobile mag-mount omni; Look for that
in the $100 price range.

You can reach FreeWave on (303) 444-3862

I have good and bad news for Baycom users. Firstly as Jim correctly stated,
Version 1.6 of Baycom is not shareware, so legally no FTP sites will carry
it. Okay, thats the bad news....now for the good.

Baycom modems can be driven with any software terminal programme using a
driver called TFPCX.EXE. I have a small directory on my service providers
file server and in it is a file TFPCX210.EXE. This is a self extracting file
with all the gen on how it works. Actually the driver loads by simply typing
TFPCX -PCOM1 -B1200 -Ifd -nd. It uses 65k of ram when loaded. TFPCX210.EXE
is available by anon. FTP from nic.funet.fi cant rem the directory;-(
or anon. ftp from ftp.iaccess.za in directory /pub/ham

I say that it will run with most terminal programmes, as I run our club BBS here in my shack off a Baycom modem (My MFJ is for me!! :-). Its a F6FBB type BBS, and I have used the Baycom with TPK 1.82 with good results.

Hope this helps with your problem.

The HP/LX family of palmtops (95LX, 100LX, 200LX) all make excellent portable terminals and packet stations. I can fit my entire packet stations into one oversized pocket: the 100LX, a KPC-9612, and Yaesu's dynamic duo -- an FT-11 and an FT-41. I run K5ZC's 95LX port of KA9Q NOS as well as a swell little general purpose comm package called "commo". I use NOS regularly to backup the palmtop to my PC via a SLIP connection, but I haven't gotten around to putting NOS on the air yet.

As to why *I* chose the 100LX over the competition:

o I'd been salivating over these little beasts for a couple of years, and just couldn't control myself when the 200LX was introduced and the prices started falling on the 100LX.

o I needed a portable terminal for occasional use on the road to dial into one of several UNIX hosts to read e-mail (or, if I'm *really* desperate for something to do, the Usenet news ;-) and even a cheap laptop was bigger and more expensive that I thought they needed to be for the application.

o The 100/LX and 200/LX both support an 80x25 character screen, which I greatly preferred to scrolling around in an 80x25 logical display area and looking at it through a 16x64 view port.

o I wanted a highly portable, battery operable packet station for emergency use (also to get online from a tent in the middle of nowhere so that my non-ham friends could scratch their heads and ask, "Why on earth would you want to take a *computer* along on a camping trip?!")

o It's a DOS machine, and runs just about everything that runs on an XT. For example, I have a copy of SuperMorse installed, and it makes a terrific time-passer when the commute over Highway 17 between Santa Cruz and Los Gatos resembles a used car lot.

My wife wanted a PIM for Christmas, and decided she preferred the Psion 3a to the LX (based on the quality of the applications in ROM, I would tend to agree with her.) We also plunked down an extra $150 for a serial interface and terminal emulator so that she can backup to the PC; I doubt that I'll be able

to resist the temptation to try it out as a packet terminal. It runs a proprietary, multitasking OS and includes an interpreted, object/event oriented programming language called OPL. (Tinkerer's paradise?) If anyone is particularly interested in hearing further about packet radio on a Scion palmtop, drop me a note and I'll keep you posted as I play around....

KB6JXT, Todd

101. Looking for a program

From: garyk9gs@solaria.mil.wi.us
Message-ID: <3eing8$grh@hummin.sol.net>
Source record: 45434

I have been trying to get Windows Terminal working with my MFJ 1274. It works great when connected to the local PacketCluster. The problem arises when I've tried to upload a text file to the node. Terminal never stops sending to the TNC when the TNC buffer fills up. I've tried playing with both the set-up settings in Terminal and in Control Panel with respect to the handshaking used. Nothing had any effect. I have no problem when using other software such as YAPP running under Windows. Any ideas??

I really like the programmable macro buttons for use with the Cluster. Are there any other Windows Terminal/Packet Apps. out there with programmable buttons??

Thanks again!

73 Gary

From: bob@kunk.n0qbj.ampr.org
Message-ID: <3eintu$jj0@distrib.jriver.COM>
Source record: 45435

Hi All,
I'm trying to modify a FT736R to work with a Paccom PSK modem for satellite use. I found out that you can't use the data jack on back and so I did the mod from WD6EHR's 9600 baud handbook version 2 to the radio.

It RECEIVES perfectly. I can monitor 9600 baud packets on several different 70cm freqs here. Unforch, it doesn't transmit correctly. The transmitter is coming on and sending but there is not a correctly modulated signal coming out on 70cm. I am using a tapr 9600 baud modem rev 1 for the test. This modem works fine with another radio. I have tried all levels of input and nothing works. I am quite certain that the connection to the modulator is as it states in the handbook.

I'm wondering if there are any GOTCHAS that might be causing me problems? Any ideas?

Thanks, Bob

Message-ID: <02JAN95.23601075.0023@ESAMATC.LIB.MATC.EDU>

I have noted some discussion of the use of Voice Repeater frequencies for Packet repeaters. As Vice President of the Mid-America Coordination Council (MACC), I would like to point out that we have given reasonable consideration of the need for Packet repeaters, to provide efficient throughput. MACC is the umbrella coordination group for over 20 state and local repeater coordination groups.

In essence, it has been determined that Packet and voice repeaters are generally not compatible. MACC has a basic bandplan providing for Packet from 446.025 MHz. to 446.200 MHz. simplex, and duplex pairs of 441.025/446.025, 441.050/446.050, and 441.075/ 446.075 MHz. These are chosen to provide frequencies in the 440 MHz. range to Packet interests without a need for coordination with the voice repeater coordinators, and to protect unpublished repeater control and audio links. These frequencies, along with the 430 MHz. frequencies that are harder to get some radios to work on, provide the Packet users with a reasonable number of frequencies for most Packet applications, I believe.

The point is, we do wish to work closely with Packet organizations, because we are using the same limited resourse. I believe our plan is reasonable, easy to use, and places voice repeaters at a minimum risk. If further frequencies are needed, discussions with MACC are welcomed. Our Annual Meeting is at the Dayton Hamvention each year. The members are in the Repeater Directory.

Coordination is a way of life in Amateur Radio. We don't really need any range wars like the ones in the 70's any more. MACC, TMARC, SERA,

TSARC and others are umbrella organizations that offer support and a measure of authority for our Coordination Warriors. We all need to hear from the Packet community with your frequency needs. I hate those re-tries as much as anyone else. Together, we can minimize interference, and further this great hobby to greater heights!

105. HELP: XPCOM operation under Windows

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-06 08:15:25 UTC
From: rmccoy@alb.asctmd.com
Message-ID: <rmccoy.4.0008420D@alb.asctmd.com>
Source record: 45447

Thanks for reading!

I am trying to get XPCOM running under Windows. Has anyone been able to make this happen. I am currently running a Doublespaced HD and a CDROM so I have drivers up for those. I am currently dinking with the .pif file unless I should be elsewhere.

The program shell seems to come up fine. The problem seems to be in the interface to the serial port for local TNC communiction. While under Windows this data isn't making it to XPCOM for screen display. Can anyone HELP!?

Actually, nothing about packet really requires "instantaneous" clock recovery. You could just grab the raw incoming signal with a fast A/D converter and store it in a buffer. Then you can take as much time as you need in DSP to find the clock phase and frequency that best matches the entire packet.

This is called "a posteriori" clock recovery detection. It has some definite advantages, not the least of which is the elimination of idle leaders that waste channels.

|> The FCC did not define what constitutes authentication.
|>
|> How about Kerberos 4 for packet radio?

The problem with Kerberos and other similar schemes is that they were designed for end-to-end authentication, not end-to-middle. Routers on the Internet don't need to verify that a packet is from who it claims to be from. But meeting the spirit of the FCC authentication rules pretty much requires that this be possible.

|> A log file that keeps all the header information from every

|> to trace the packet back to its source. (I've always suspected
|> that the real purpose of packet radio is to deliver headers
|> and not content).

Seems like overkill. But you're right about headers vs content. CW is even more "efficient" - 100% headers! :-)

|> Sometimes, I wonder which is worse; a neanderthal ham radio
|> establishment, or a reactionary FCC. Either way, the future
|> looks bleak.

Tell me about it. Living in a supposedly "free" country, I really get depressed by the widespread view, eagerly embraced by many hams and no doubt rooted in decades of hot and cold wars, that two-way radio

communications in the hands of ordinary people is so intrinsically "subversive" that the government must carefully monitor and control its use. Only in the past 10-15 years has it become possible for the average person to obtain a truly useful two-way radio service: the cellular telephone. But they're completely dependent on a fixed infrastructure that in many ways is even more amenable to rigid government control (the recently passed FBI wiretap bill was aimed largely at cellular systems).

Of course, the government no longer cites the danger of Nazi or Communist spies using secret transmitters to send their reports back to Germany or Russia. Even the average ham wouldn't buy an argument like that. The original reason for creating the FCC, and the only one still remaining for the issuing of individual transmitter licenses and restrictions on the uses to which one may be put, is the scarcity of spectrum and the desire to prevent interference.

This is an argument eagerly accepted by the average ham, who is so easily frightened of the "commercial abuse" bogeyman -- or so turned on by the prospect of playing amateur policeman -- that he's willing to give up his right to do almost anything interesting on the ham bands.

Given the traditional limitations of the technology, the "spectrum scarcity" argument has always had wide appeal even though it gave the FCC an excuse to go far beyond its original mandate of minimizing interference. The FCC's social engineering activities are legion, and now they're fast evolving into a major revenue center for the US Government.

Sigh.

|> It's 1995 and counting. I talked to someone in Paris the other day
|> while sitting in my cellar turning 100 watts on and off.

Please don't take what I'm about to say as an attack. But in an idle moment a year or so ago I wrote a shell script for my PC at home that achieves WAC (Works All Continents) over the Internet in about 9 seconds. Including both Australia and Oceania, and including Antarctica.

I could have done it even faster had I done the pings in parallel. And it goes without saying that I can routinely communicate by email with any of those places any time I like.

Anybody can do this. All you need is a PC, a modem, and a dialup SLIP/PPP account with your friendly local Internet service provider ($15-35/mo, depending). Much lower capital costs, no tower ordinance problems, no RFI, no HF propagation vagaries, no satellite visibility schedules (except to South Pole Station), no operator license required, no restrictions on business use, and no QRM (unless I voluntarily read USENET).

This has kind of taken the luster off ham radio for me. I know, there are still reasons to experiment with radio for its own sake. But you have to admit that ham radio is no longer alone on the list of hobbies in which you can "talk to the world".

BARTG * GB2ATG * NEWS * BARTG * NEWS * GB2ATG * BARTG
This is the - British Amateur Radio Teledata Group - News Broadcast
Service for all Amateurs and Short Wave Listeners interested in RTTY
Amtor, Pactor and Packet Radio.

This news is broadcast during the first full week commencing Monday
each month, to the following schedule..

Evening transmissions at 20:00 U.K. local time on 3.584 MHz. Mark.
RTTY on Monday-AFSK, Wednesday-AFSK and Friday-FSK.
Pactor-FEC on Tuesday.
Amtor-FEC on Thursday and Saturday.

Morning transmission at 10:00 U.K. local time on 7.041 MHz. Mark.
RTTY on Sunday-FSK.

Both frequencies could be +/- for QRM.

An edited version of this bulletin is available on the Packet
network as a BARTG at GBR. file thanks to:
Andy (G3ZYP) BARTG Publicity Officer at GB7MXM.#36.GBR.EU.

It is also posted on the "INTERNET" system via the INFO-HAMS list
on UCSD.EDU. thanks to Iain (G6ARO) who is available on the
"JANET" network as Iain@HUMBER.AC.UK

News for January 1995. Bulletin No. 025.

BARTG Information.
BARTG officers and committee, plus the GB2ATG news team, wish all members and
news readers. Good health and prosperity in 1995.
May all of mankind help to make man kinder.

DX Activity. (All times are GMT.)
14 MHz. RTTY.
9G1BS, FK8GM, VK9NS, JD1AMA, A41KD, CN8BX and EA9KQ 0830,
EA6MQ, PY2XB, VK5ACP and CE8SFG 0900, ZL7AMO, HL5AWS and S52GN 0930, YK0A 1130,
PJ2MI 1200, T70A, ZC4ZZ and A71EY 1330, SV5AZP 1400, OD5PL 1430, 9G1BS 1500,
CU3EM and TA2II 1530, VI0ANT, G4VXE/C6A and VE9VS 1600, ZS5VF and EA8PDT 1630,
3B8CF 1730, PZ1BS 1800,

14 MHz. Pactor. CT3AR 1530.

21 MHz. RTTY. 3DA0CA 1400.

QSL Information.
YK0A via W6OAT. OD5PL via HB9CRV. ZL7AMO via ZL1AMO, JD1AMA to CBA.

VK9NS direct only to CBA. G4VXE/C6A to home call. VI0ANT via VK4EET.
9G1BS to John, Box 3248, Accra, Ghana.

QSL Bureau, EY (ex UJ). Nodir Tursoon-Zadeh, EY8MM, vice president of TARL (Tajik Amateur Radio League), advises all amateurs to use the EY/UJ QSL bureau at P.O. Box 303, Glavpochtamt, 734025 Dushanbe, Tajikistan.
Do not use the Box 88, Moscow route for EY cards.

Contests.
The first annual World-Wide RTTY WPX Contest sponsored by the American Digital Radio Society takes place during the first full weekend in February.

Starts: 0000 Saturday, February 4 until 2400 Sunday February 5.

Contest Period: Single and Multi-Single operators may only work 30 hours of the 48 hour contest period. Rest periods must be a minimum of 60 minutes, clearly marked in the log.

Bands: 3.5, 7, 14, 21 and 28 MHz. (no WARC bands).

Modes: All digital, RTTY, Amtor, Pactor, G-Tor and Clover.

Classification:
1. Single operator, high power, low power, all band and single band.
(A) Single operator station, one operator performs all logging and operating duties.
(B) Low Power. Output power not to exceed 150 watts.
(C) Single band. High and low power mixed.

2. Multi-Operator. All band operation only, no power classes.
(A) Single Transmitter. Only one transmitter and one band permitted during the same time period.
(B) Multi-Transmitter. No limit to transmitters, but only one signal allowed per band.
Note:: DX Packet Cluster and DX alerting is permitted in all classes of operation.

Exchange: RST plus a progressive three digit serial number starting with 001. Multi-Transmitter stations may use a separate series for each band.

Points:
A Contacts outside your own continent score three (3) points on 28, 21 and 14 MHz. and six (6) points on 7 and 3.5 MHz.
B. Contacts within the same continent, outside your own country score two (2) points on 28, 21 and 14 MHz. and four (4) points on 7 and 3.5 MHz.
C. Contacts within the same country score one (1) point on 28, 21 and 14 Mhz. and two (2) points on 7 and 3.5 MHz.

Multipliers:
Each different prefix is worth one miltiplier, counted once only and not once per band.
The letter/number combination forming the first part of the amateur callsign will be considered the prefix.
e.g. N8, W8, WD8, WB2, WD200, KC2, KC200, OE2, OE5, G4, G0 all count as separate

prefixes and multipliers.

Scoring: Total QSO points times the number of different Prefixes worked.
A station may be worked once on each band for QSO credit.

Low Power: Output power must not exceed 150 watts. You must indicate Low Power on the summary sheet.

Awards:
There are over 30 trophies and plaques on offer for the leading stations in all categories and most continents. Certificates will also be awarded to the highest scoring station in each category, every participating country and each call area in the U.S., Canada, Australia and japan.

Log Sheets:
All log entries must be post-marled no later than 30 days after the end of the contest. Send your contest entry and log or disks to:
Jay Townsend (WS7I). P.O. Box 644, Spokane, WA 99210-0644, USA.

Copies of rules, Log and Summary sheets are available from the editor (G0ARF), please enclose A4 size SASE.

Notes of Interest.

9N, Nepal. Members of the Japan UNICEF Ham Club expect to be active from Nepal from january 1-7 with all modes including RTTY.

9G, Ghana. John 9G1BS will be in Ghana for the next two years. Direct QSL's are answered almost return of post.

Antarctica. Australian base. Eddie VI0ANT is at Davis base in the Antarctic until end of march 1995, CQ zone 39, ITU zone 69.

Antarctica. Italian base. The correct callsign of Luciano, I0JBL is IA10PS to celebrate the 10th. anniversary of the base.

ZL7AMO provided long periods of RTTY from Chatham Isl.

DU, Cebu Isl, (IOTA OC-129). Look for Tom SM0CNS/DU7 on all bands mainly CW, but equipped for RTTY if requested.

VP8, South Shetland Isl. SP3FYM is expected to be on the air signong HF0POL from mid December until late 1995. He intends to concentrate on RTTY and 160 meters. SP2JYV may be active from King George base from December on all bands using CW, SSB and RTTY.

VP8, Falklands and South Georgia Isl's. Operations from SGI are expected to take place from January 4 till 19.

XR0, Easter Isl, and Sala Y Gomez Isl (new IOTA). Early news of a planned DX-Pedition to this location with hopes of 24 operators, 12 from each location, running simultaneously for a 2 week period. Tentative dates are August 26 until September 14 1995. The venture is proposed as a joint scientific and radio science project to include digital mode operation.

5H, Tanzania. Jim, 5H3JA is especially active on digital modes and is expected to be in tanzania for about 6 years.

Thanks this month to..
G3ZYP, DXNS, ARRL/ARLD, KB8NW/OPDX/BARF80, VK2SG/RTDX..

BARTG caters for all DATA interests with information-components-kits -ready built units and software from experts. Members receive a 120 page quarterly journal devoted to data modes. Beginners guides for most data modes are available. The group sponsors HF and VHF RTTY contests, administers its own DX and members award scheme and runs an annual rally.

This copy of BARTG News is posted by Iain Kendall (G6ARO) who can be contacted via Internet e-mail at.. iain@humber.ac.uk Items for inclusion in the broadcast may also be mailed to this address, as well as any queries regarding membership or services offered by BARTG.

Copy of the news as distributed by G0ARF 941227.

> hobbies, they've paled and I've moved on to the next thing.

And we all have had other hobbies... I play the guitar and I sail and I kayak and I fly gliders and I ride bicycles and for the seventh or eighth time, I've come back to ham radio... You haven't been a ham long enough to see the changes in ham radio...

There was a time when ham radio operators were pretty close to the leading edge of technology; where ham radio operators did some excellent development and turned that development into businesses and profitable hobbies... Now we have Japanese manufacturers...

One of the best things that is happening in ham radio today is this DSP development going on right here in the TAPR HFSIG... Johan Forrer and Phil Karn and the bunch are going to give us software for our sound cards and PC's that will allow us to do many and better digital modes... And maybe a new company will come out of it...

But there ought to be thousands of developments going on like this... And we are many times hampered by the regulations imposed by the FCC...

The FCC certainly doesn't add a lot to ham radio... They don't crack down on the LIDS on 75 meters who get on every night drunk and curse and shout and make a mockary of the gentlemanly ham radio that I have known... They don't often prosecute the local repeater jammer, jerk...

So what's the FCC's purpose...? I think that issuing a license number is the only thing that they are doing for us... And they don't do that very well... I guarantee that I can write a program in a week that will allow you to call in and get your new license call sign 1 minute after you pass your test and have it authenticated... I am sorry that the proposal to allow someone besides the FCC to issue call letters did not pass...

So why not deregulate ham radio...?

> Life is more closely modeled by fuzzy logic than Boolean. There is a
> continuum of answers all broadly correct no one of which we must all
> subscribe to. Maybe ham radio has become empty for you and it's time
> to do something else to re-energize yourself. That's OK. But remember
> that to many of us it's still active and vibrant and fun. Don't write
> it off on our behalf.

I am not writing it off... I want to make it vibrant again... Ham radio has not become empty for me... I am here and I am hamming... I just can see how much better it could be if we had some leadership and direction in it... The ARRL certainly doesn't do that... They are in cahoots with the FCC as far as I can see... Wayne Green has mounted a leadership effort in the past but he is considered a radical by many in the hobby and so he goes largely unsupported...

It would just be easier to be re-energized if there were some new challenges... And new challenges require new frontiers and that requires less restrictions in this kind of hobby where we are using the "public" airwaves... We have all made contacts around the world and we are looking for different, i.e. technical, challenges... We don't want to tell other people what kind of antenna and what kind of Japanese radio we are using...

Many years ago, hams with mobile rigs in their cars and access to auto-patches were the "policeman's helpers"... I have made dozens of auto-patch calls to the police about accidents and safety hazards in the course of driving around town, as have many hams of a few years back... Have you heard anyone doing that lately... There are thousands of people in cars with cellular phones who can do that much easier than a ham can now days... What with stupid auto-patch restrictions, the hams have been forced out of that area, entirely...

Had hams had the incentive, cellular development could have come from ham radio... It would be very easy to link repeaters with digital messages on sub-audible tones and allow instant communications from within our cars to repeaters all over an area... And even do automatic switching as you roll down the road... All with a simple computer system using old sub-audible tone technology... But there was no incentive to do that because of the knowledge that FCC restrictions would "shoot down" the development, as happened so many times in the past... And so now cellular phone systems dominate the countryside...

And the next encroachment on our frequencies is coming down the pike... Wireless LANs and WANs are all the talk in computer and communications publications... There are lots of ham radio frequencies that commercial interests want desperately to be able to sell the next digital frontier... Ham radio needs to be using those frequencies now in just this way... We need to be developing those LANs now, to connect ham BBSs all over the country... And we need high speed digital links on HF bands to be able to get the ham radio data all over the country...

I guarantee that the cellular system will be unusable in an emergency... Right now 700+ cellular phones in airplanes spaced around the country will lock up the cellular system... I'm a pilot and I have to tell my passengers every day that they can't use the cellular from the aircraft for that reason...

And we hams are not going to be prepared for the data transmission needs of emergencies... If you have ever listened to voice and CW traffic nets, you understand the need for high speed digital communications... The HF/VHF digital forwarding system that is in place now is the beginnings of this

system... But that system is stymied by this bureaucratic BS and that needs to stop, no matter what the fate of ham radio...

And this is where I came in to Phil's message...

73...

waf@sunfish.zk3.dec.com (William Freeman USG) wrote:

> What a bunch of whining ninnies. You can't get your way
>without working for it, so you forcast the death of Amateur Radio
>(granted, elimination of the code requirement dealt it a mighty blow,
>but it still seems to be standing). The FCC has taken an intractable
>issue and made it subject to technical solutions, and you complain.

Well, Bill, we aren't a "bunch of whining ninnies" as you so ineptly call us... We are seriously trying to get some discussion going here to save ham radio... Eliminating the code requirement hasn't done anything but make it stronger... Have you tried to buy a used two meter radio in the past year or two at a hamfest... They are largely unavailable... And dealers are seeing record sales of all kinds of radios...

Now that in itself will keep radio alive for a while, but it won't make it healthy... To be healthy it has to be growing, both physically and intellectually... And intellectually is what you are complaining about... The brains of ham radio are gone... The body is there but the brains are gone to computers and elsewhere... Oh, there are a few still around, doing things that are fun for them, but they are not making major contributions to the fraternity... And you think that keeping the code requirements around will keep out the "riff-raff"... Well, it won't work... Listen to the crap that is spouted out on 75 meters every night and on 20 meters a lot of the time... Those guys passed their 13 wpm code test... I think there is more civility on most VHF repeaters than on HF freqs...

The only place there is mostly gentlemanly operation is on digital modes... Not being much of a CW op (ever), I speak mostly about RTTY, PACTOR, AMTOR... I am sure CW is basically the same way... It seems hard to me to curse someone out on CW... And I know that when you type something to someone, you have to think a little more about what you are communicating...

You maybe read that I personally was in favor of keeping the 5 wpm code requirement... I think that everyone can learn 5 wpm and it is required by international treaty, not that those things make any difference any more... And I would like to see a much more comprehensive, up to date technical test for licensing... I feel like that made a license in the past, a desireable thing to obtain... Hams in the "good old days" where considered to be technically superior individuals... A desire to be strived for... And yes, today, there are times when I am ashamed to say that I am a ham... Most people today lump hams in with CBers...

As you know, most things are worth just what you pay for them... Not necessarily with money, but many times with the sweat of your brow... Ham radio is that way... I worked hard as a teen-ager to get my general class license... I was as proud as any young boy could be when my license showed up in the mail... I still am proud of that license... And I know that most of the hams today are proud of their licenses, too...

> You always were responsible for the content of the messages
>you forwarded, that's not new. Those guys on 20m SSB or who are doing
>CW for the TCC also were, and continue to be, responsible for the
>content of the messages that they forward. But they're aware of the
>content by virtue of their mode, and so can censor the unacceptable.

As can Packet BBS operators... But that doesn't mean that they should necessarily have to... If you are a jerk and send something out over the packet BBS system, I'm going to take you, Bill Freeman, KE1G as a jerk, not the packet BBS operator you forward through... And if your BBS op gets enough complaints then he can dump you off his BBS, if he wants...

Did you ever wonder why the FCC made listening to Cellular Phone conversations illegal...? It took the burden off them to regulate the conversations on good old narrow band FM cellular phone... Lot more nasty crap going on there than on any of the VHF repeaters using basically the same frequencies and modes... Bill, if a tree falls in the forrest and no one is around, does it make any noise...?

> But it's a pretty severe burden for automatic digital
>forwarders, so the FCC takes pity on you.

Bill, did you ever think that maybe the reason the FCC regulates hams and not the general public on cellular is because hams WANT to be regulated... Maybe that's why we went to the trouble of getting licenses and playing by the rules... Almost every great person in the past has violated the rules... Visionaries have gone to insane asylums and prison in the name of development of new ideas...

Maybe this regulation of ham radio has distracted those very people who we need to make ham radio a force to be reckoned with at the beginning of the 21st century... I'm not talking about the guy who goes nuts and spews out filth on the local repeater... I'm talking about the guy who could develop that cellular repeater system but doesn't because the regs prohibit it on ham radio...

> No, apparently the technical
>challanges you want to solve are of the form of how to avoid paying
>for an internet account and second phone line, so that while your
>daughter is talking to her friends you can still read alt.sex.bondage
>and post your advertisement for commercial products like ham oriented
>CDROMs.

Oh, come on, Bill... You must be joking here... Obviously you have read alt.sex.bondage, because you seem really knowledgeable... Does your wife know that...? On a more serious note, most of the hams that I know who are at the forefront of technology couldn't wait to get an Internet account and

most have SLIP accounts and most have two telephone lines so they can have uninterrupted access to one line for data...

> I guess that I'll write to the veep lest he think that you
>guys speak for every ham. If there's a "silent majority" out there
>(though I expect that most such have been offended away from this
>newsgroup by now), I suggest that you do the same.

Nope, Bill... None of us are going to leave so you better go back to alt.sex.bondage... Ham radio doesn't need any silent majorities... We need a ton of vocal majorities... And you are already in my article for some ham magazine... It's my New Years Resolution...

> We may disagree, but I still mean the 73 below.

And 73, to you, Bill... I think that you have enough intelligence to consider that maybe we have some valid points here...

>
> Everyone's always talking about getting used motorola and GE radios
>cheaply and getting them going on 9600b. Is there a source for these
>radios that I don't know about.

Well I don't know whether you know about it, but large hamfests usually
are awash in the things. Dayton probably has several tons of Moto and
GE rigs for sale in the flea market area each year. Other large hamfests,
such as Shelby and Atlanta, do too. Then there are dealers in surplus
land mobile equipment. Get a copy of _Mobile Radio Technology_ and look
at the ads in the back. $50-$150 GE and Moto rigs are plentiful there.

>There are SO many different types of these
>radios out there. Low Band, High Band, Micor, Motrek, Motrak, Master,
>Master II, MVP, Custom MVP, etc. I'd like to pick up 5 or 6 rigs (for the

>look.
> Yesterday, I saw a GE Custom MVP (I think that was it) that was about
>the size of a lunch box. All the other GE rigs I've ever seen (and
>Motorolla too) have been the briefcase/boat-anchor type. What's the
>difference between the 'lunchbox' size rigs and the briefcase size rigs?

The MVP and the Exec II are pretty much identical where it matters,
except for packaging, and the PA deck. The MVP uses a lower power PA
than the trunk mount Exec II. The Exec II can also have large multi-
frequency decks installed that won't fit in the MVP. The control boards
are different physically, but identical electrically. The exciter and
receiver boards are the same and can be freely swapped.

> If someone could tell me the 'right' rig to look for and where to find
>them, (a phone number perhaps) I'd really appreciate it. It would really
>be nice if someone would document this stuff someplace. Thanks.

It would take a large book, in fact several books, to document all the
different Moto and GE rigs out there. The best route is probably to buy
a bunch of service manuals. GE and Moto manuals are still available for
most of these rigs, and there are dealers in used manuals as well. Then
after digesting the manuals, hit the hamfests, preferrably with a
knowledgeable friend, and shop until you drop.

>moment a year or so ago I wrote a shell script for my PC at home that
>achieves WAC (Works All Continents) over the Internet in about 9
>seconds. Including both Australia and Oceania, and including
>Antarctica.
>

I don't see it as an attack, it's kind of non-sequitur. Yes, it's
possible to ping virtually any continent/state/real (as opposed to
DXCC) country. And if you're a network fan, there's excitement to be
had there. Way cool. Wicked Pissah. Nothing to do with radio.

Yeah, a lot of radio contacts are about as informative as a ping as
far as extending the frontiers knowledge or advancing the state of the
art. What did I talk to the guy in Paris about? He told me where he
was, I told him where I was, he told me what kind of radio he had and
insisted on knowing what kind I had. We exchanged 73's and I spun the
dial. A ping QSO if ever there was one. But that wasn't the point to
me; making the contact was the point.

A few years ago on the net there was someone arguing that DXCC was
pointless because it's been done and it's not proving anything to do
it over and over. And from one mindset there's truth there. But the
fact is that *I* haven't done it, so it's exciting to me. Working
OSCAR-13 Mode B doesn't push the envelope, But it's hot stuff to me.
And this is *amateur* radio! By definition, we do it because we love
to do it.

Do people stop running the Boston Marathon because the course has been
run before? Certainly enough people have crossed the finish line that
we've shown that a human can run that far. Should they stop running it
because on an idle day you can drive the course in 9 minutes and
arrive at the end without breaking a sweat? Sounds silly, huh? So why
ditch radio?

[material deleted]

Nels, I'd like to hear more about how it was determined that digital
and voice repeaters "are not generally compatible." I'm working on a
Minnesota Repeater Council committee tasked with drafting a
recommendation for digital repeaters. I've received information from
areas where digital repeaters are operating with the voice repeaters in
the traditional voice repeater sub-bands, including in major
metropolitan areas. It is not at all clear to me that there are any
significant problems that are intrinsic to the mode used. In other
words, the problems that have been encountered happen just as often
with co- and adjacent channel voice repeaters.

Baycom is available at Ver 1.6 now, but not at any FTP site
legally. It is not public or share ware. It is sold in USA by
PacComm and one other place (I forgot which) for about $20.
You can run GP and a few other programs on a Baycom modem
instead of Baycom software. But, I find them to not be as useful
as the original. I disagree with your assessment of "kludgy", and
think it's very easy to use, and easy to set up. -pat

>fixed frequency.

>Larry W1HJF

Let me be the first to warn you that you will be able to find the
Moxies and Mitreks and other Motorola radios that can all be modified
and made to work at 9600. But once you've done the mods you will need
to realign the radio. This my friend is where you had better know what
your doing and have the proper test equipment to do the alignmet or
know someone who is able and willing to do the aligning for you.

I was told about the Mitrek and found a couple at the local flea market
and brought them home... Finding the documenation for the mods and
doing the actual work was no problem. Then the alignment was needed..
Well I sure didn't have all the test equipment do do xmtr and rcvr
alignment on 430 mhz and finding anyone witht he proper test equipment
wasn't easy.. Then I found a ham who was a Motorola technician and
had the equipment but didn't have the time..

For my money, I'll go with the TEKK radios which I now use and if
you have a Moxie or Mitrek, strip out the PA and use that on the
back end of the TEKK radio... You'll save yourself a lot of trouble
in the long run and $100 or so will seem cheap...

If your a technician with the proper test equipment to do the
alignment, please post such to this group and you will be kept
busy for years...

I'm very happy with my TEKK radio and we're currently working on
the 433.43 mhz 9600 baud network in the S.F. Bay Area..

Good luck with whatever you try....

Great that there's a solution for DOS users, but that doesn't help me
when I want to use Baycom hardware under Linux or any other OS than DOS.

Is there something like the C source of the Baycom software available?

Thanks and 73

I would like some advise for a friend.

He will be stationed about 20 miles outside of Lusaka, Zambia for two years doing humanitarian/missionary work. The university in Lusaka will provide internet access, but the locals scavenge the copper from the land lines each time they are installed.

Is a reasonably inexpensive connection possible under these circumstances?

What Gary said. I don't know where you live, but the Rochester NY and
Rochester, NH hamfests usually have them. I'm sure there are plenty in
Daytona, and you'll find ads in both "Communications" and "Mobile Radio
Technology"

: legally. It is not public or share ware. It is sold in USA by
: PacComm and one other place (I forgot which) for about $20.
: You can run GP and a few other programs on a Baycom modem
: instead of Baycom software. But, I find them to not be as useful
: as the original. I disagree with your assessment of "kludgy", and
: think it's very easy to use, and easy to set up. -pat
```

Thanks for the info. I may give PacComm a call and pick up the latest version. As for my comment about it being kludgy: I am comparing it to other telecommunications software, such as ProComm Plus for Windows and such. It would be nice to find a driver which allowed you to use the Bacyom modem with stanrard dos/windows terminal programs.

I did try using "tfpcx" as one other fellow mentioned, but that driver will not work with Windows running.

Sorry Hank, I guess I took the original question to be worded the other way around and that made your "No" come out against the idea. I have had others tell me it was in fact illegal, but have yet to have anyone explain why packet would be any different (legally) from voice. I personally ran a 2M/INTERNET Gateway for a number of years. I was told this was: a) illegal, b) technically impossible, c) a very bad idea, d) impossible to control, e) all of the above. I was never cited for this operation, and I know of no case where the system was abused or used for anything in violation of FCC regulations. I am often amazed at how many hams go out of their way to tie their own and other ham's hands all the time complaining about how the FCC is too restrictive and is stifiling advancement.

All the best.

132. IC737 & Vester SSTV circuit

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-07 16:52:52 UTC
From: eengel@eskimo.com
Message-ID: <D21o84.5xn@eskimo.com>
Source record: 45464

Has anyone tried the Vester SSTV circuit in the Jan.'94 QST,with an Icom transiever? The circuit has a 8 ohm output to the transmitter. The manual for the IC737 show an impedance of 600 ohms at the mic input pin and 10 k ohms at the ACC(1) mic input pin. How can this mismatch be handled with this circuit?

I'd appreciate any help that any of you experienced SSTV players can offer.

hope this is the right place to post this....

i have an ADDS model VPT90 monitor which i had used
for a "dumb" terminal for packet. i had not used it in
several weeks, and when i turned it on again it came up
in graphics mode. does anyone out on the net know anything
about this monitor, and what it takes to bring it back to
life? the only problem i have found during initial attempts
at debug showed a lithium back-up battery that read only
1.5 volts (monitor is about 11 years old, i believe).
any responses welcomed. 73.....

Source record: 45467
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew

Just curious if there is any work going on with generating quadrature modulation from a PC sound card (such as the DSP16 / AD2100 based cards) ??

Seems like you could have some fun with one of these single chip quadrature modulators such as RF Micro-Devices RF2703 and then using the stereo output of the sound card (L+R), drive the I+Q inputs of the modulator... software on the DSP then decides if you are doing SSB, FM, FSK, etc...

You'd then put your analog signal to be transmitted input one of the sound card's input channels (L or R)...

Of course, the whole thing might be reversable, so that demod could be done as well.

Inquiring minds want to know...

Chris

I haven't seen any Baycom implementation work under windows. The
Baycom driver needs to camp out on the serial port to get all the
bits in real time. If there are any task switches in windows
that cause it to freeze, it will stop bit stuffing. So, Baycom
is a cheap packet system, but only if you want to dedicate a
whole computer to it. I use an old AT.

He might have to add a command to his .bat file to install it.
The syntax is tnctsr-(s,l).exe. Either the s or the l, but not both. If thats
not the problem, then make sure his system configuration has the correct
address for the card, and is loading the way it should be. I use a hapn-2
card with tnctsr-s and sp6.50. If you have any other questions, you're
probably going to have to find it in the docs. Sorry I can't be of more help.

142. How do you get KPC-9612 to transmit 9600 under KISS?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-08 07:35:21 UTC
From: kanefsky@halcyon.halcyon.com
Message-ID: <3eo4jp$jfp@news.halcyon.com>
Source record: 45475

I can't seem to get my Kantronics KPC-9612 to use port 2 (the 9600 baud port) when I'm using applications that require KISS mode (e.g. NET/Mac, Savant). In normal mode, I can use the stream-switch characters or use the PORT 2 command with a communicatons program to change the default, but even the default seems to be ignored when I switch to KISS mode.

While your rules are different from mine, I would suggest this is
unwise. Who is responsible if the person on internet throws in some
offensive words and they get transmitted on packet via your station?

That is why the internet mail gateway stations take care regarding what
they will pass onto packet.

Dave

145. AEA PK-96

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-08 15:15:00 UTC
From: jpuckett@cc.weber.edu
Message-ID: <8JAN199508150509@cc.weber.edu>
Source record: 45477

Does anyone know if the AEA PK-96 will do a wraparound test at 9600baud?
The unit I have does not seem to work on 9600 so I tried disconnecting
the radio and jumping the green and white (TX audio and RX audio) and
calling myself. On 1200 baud this works fine but on 9600 it does not.
The unit is still under warantee and befor it goes out I want to verify
that it works. I called AEA tech support and they dont have a clue.
I also asked what the two frequencies (audio) that 9600 uses, they are
AFSK, so I could look at them with an audio spectrum analyser, they
did not know. If you can help please E-MAIL.

Thanks in advance.

Jeff,

My PK-96 does the loop back test quite nicely at 9600. You may need
to increase the AFSK level a bit. 9600 is NOT just 2 tones like 1200 is.
9600 is FSK and will cover frequencies from 10 HZ to 4500 Hz. So looking
for 2 tones on a scope will be an effort in futility. Make sure the HB
is 9600 not 1200 too. The white wire is the Tx data wire and the green
wire is the RX data wire. So the reason AEA did not have a clue as to the
2 frequencies of the 9600 tones as there not just 2 tones. My PK-96 is
doing TCP / IP nicely on UHF driving a TEKK radio. With a scope you should
see a transmit waveform on the white wire. Good Luck.

Does anyone know of a DSP filter that notches out correlated noise
from 0-700 Hz, cancels uncorrelated noise from 700-800 Hz, and
notches out correlated noise from 800-10000 Hz? What a sweet CW
filter, eh?

well, since you've got a real TNC, you'd just hook it up to the computer's serial port and use either the windows terminal or the os/2 terminal programs that came with os/2....

(of course, i'm found a lot of "packet programs" to not be very good and always seemed to me to be harder than just being in dumb terminal mode and directly entering and receiving stuff. a really good "packet program" would eavesdrop on the channel, collect tidbits from other stations and product a coherent result when complete...so i could look at all traffic from the BBS..might save having to log in myself...)

Message-ID: <3eq672$2aj@nic.scruz.net>
Source record: 45487

Hello All-

I am interested in finding information on the IXO, TAP, and PET protocol
for sending alpha/numeric messages to- of course, alpha/numeric pagers.

I have access to commercial pager/eMail gateway software, and
have examined its debugging-mode output. From this I have learned the
negotiation process that it and my paging service (PageNet Nationwide)
use. However, I have not figured out what appears to be a checksum value
that must follow the message text (or the entire page is ignored).

This three-character code consists of alpha, numeric, and some special
printable characters (< = ; -etc.). I have looked -apparently in the
wrong places- for an explanation of this code and the protocol-format
in general.

Any information would be greatly appreciated.

Thanks,

This would be cool, but I think you need DC output levels, and the soundblaster
outputs are AC-coupled.

Of course, you could add a couple of cheap DAC chips to the board with the
modulator...

I saw in a QEX article (I think) a block diagram of a DDS chip that had
DIGITAL I+Q inputs. This would give you a 1-chip SSB exciter!
You could probably hook it up to the parallel port. and just
use the soundblaster for the ADC.

Hi Rick:

It's been a while! How have you been?

MACC, which Minnesota belongs to, has put forth a plan to place
Packet repeaters in an area of 440 MHz. that is away from voice
repeaters. Three duplex frequencies are provided for.

In comparison, RTTY used the same frequency for repeaters, 146.70 MHz, and anyone using that frequency for voice knew RTTY could possibly be heard in band openings.

Our plan only sets aside specific frequencies that are away from the voice repeaters to provide good throughput, are easy to place radios on and won't interfere with distant voice repeaters in band openings.

I'm suggesting that those frequencies be used before getting into the congested voice repeater area. Those frequencies can be used multiple times without much problem, closer than voice repeaters in many cases. I doubt the massive Twin Cities area needs more than 3 Packet repeaters at all! If there is that much traffic, and all 3 Packet duplex frequencies are used, THEN consideration of Packet on a voice pair out to be done.

The MACC plan is reasonable, well thought out, and designed to make life better for Packet, and Amateur Radio in general.

Now, after this, please tell me WHY the plan doesn't work!

From: ajf4@ukc.ac.uk
Message-ID: <8855@raven.ukc.ac.uk>
Source record: 45294

Hello all,

I am a finalist undergraduate working on a 9.6kBaud data link project using the 10GHz Amateur band.

At the moment, I have two ex US military microwave units (full duplex) and have the following problems.

There seems to be a very noisy tone present in the transmission, it's fundamental is at 2.7kHz but has many harmonics... This is a problem as I have built two G3RUH modems (now working perfectly back to back) which have data spectrums up to 7.2kHz.

I have tried, for an experiment, filtering off this 2.7kHz tone with a notch filter... But alas, it ate my data! (can be expected really, but it was only a try!).. Anyway, transmitting data one way across this link results in the received data 'eye' being as closed as... (well, very closed).. In fact, virtually indistinguishable!

Also, as these microwave units work in full duplex... The transmitted audio (mic) can be heard in the ear!! This is obviously going to confuse the modem as it will be hearing its own data as well as the data from the communcating modem!!! It seems as though the signal is being 'reflected' by the receiving radio as when they are out of tune this signal does not get fed back, only white noise is heard then! (Do you see what I mean?)

However, I do not have any circuit diagrams, manuals or anything for these microwave units, therefore I am finding it extremely difficult to find my way around inside!!!! Does anyone have any such details.. The units are as follows :-

ex- US MRA 301 (serial number 037)
made by Tellurometer (INC)
Contract number DA-11-184-AMC-750(T) US

These units used to be used for distance measuring.. The distance measuring equipment has been removed and left with the speech audio etc. Each are green, big, and very soldier proof!! The dish antennas are on the front of the units with a detachable feed horn.

I would very much appreciate it if anyone could forward any cct diagrams to me....

In fact.... HHHHHHHEEEEEELLLLLPPPPPP!!!! ;).. 25% of my degree is resting on this project! (Well 25% of my final year anyway).

Ummmmm errrrrrr, well I guess that's about it! Sorry to drone on about this for quite a few screens...

Your microwavingly (and hopefully),

Ah, let me look up there at the header again. Yep, this is a digital
radio group. That sort of WAC activity certainly *does* have everything
to do with radio if the networks are amateur radio networks. Unfortunately
they aren't, and that's the subject of this thread. Due to backward government
regulation, and backward attitudes, amateur radio networks are shackled in
such a way that the sort of WAC mentioned above isn't reality. Instead it's
some kind of Society for Creative Anachronism nightmare populated by luddites.

> Yeah, a lot of radio contacts are about as informative as a ping as
> far as extending the frontiers knowledge or advancing the state of the

> me; making the contact was the point.

That seems so sad to me, just passing that old shuttlecock back and
forth through the hand loom one more time. It reminds me of the parable
of the servant who hid his talent under a bushel, fearful to undertake
his responsibility to make it grow and prosper.

> Do people stop running the Boston Marathon because the course has been
> run before? Certainly enough people have crossed the finish line that
> we've shown that a human can run that far. Should they stop running it
> because on an idle day you can drive the course in 9 minutes and
> arrive at the end without breaking a sweat? Sounds silly, huh? So why
> ditch radio?

Who wants to ditch radio? We're talking about pulling it *out* of the ditch and bringing it up on the high road where it belongs. There's a superhighway waiting to be built, puttering around in a ditch doesn't get it done. Remember, a ditch is just a big deep rut. If it takes dynamite to blast amateur radio out of it's rut, then dynamite it will have to be.

It *is* silly to run when you can drive, to drive when you can soar, to soar when you can rocket to the stars. Only if we forge our own shackles of superstition, ritual myth, and arcane rites of passage are we barred from rising to greater glories. Shall we continue to curse the darkness, or shall we each light one little candle along the road?

1. Does the program run correctly under DOS?

2. Be sure that you have TNC TWO set to not installed if
you are running only one TNC.

3. Be sure to set Tranceiver Interface to NONE, unless
to have a supported tranceiver and it is interfaced
to you computer via the appropriate hardware, ie IF-232
interface etc.

4. Are you running non-standard IRQs, if so be sure to
set the proper IRQs up under XPCOM and the WINDOWS
control panel.

5. What kind of TNC are you using?

I know there are more questions here than answers, but I might be
to help a bit more with a little more information. If you wish
you may contact me directly via E-MAIL at the address shown below.

My apologies. I mixed up two messages when the patch details went
out originally.

The byte is at 14d9 not 14d8.

I hope to get a release out in about a month with this patch in it.
In addition, it cures a couple of other funnies, has a heard list
for L3 NetRom gateway nodes (works like the main heard list but
records stations that gateway through the node), and will automatically
update the ARP table by accepting ARP replies and issuing ARP requests.
There are also a few other changes.

I'll upload it when it has been fully tested.

Johan, KC7WW, who has written some articles for QEX on the Cardinal DSP16 sound card, which uses the ADSP-2115, told me that someone has done something like this for an Rx with the Cardinal card. He used a DDS oscillator and mixer, converting down to baseband I + Q, and doing lots of processing on the DSP.

Hi, I got Sp6.50 to load and run under os2 today. I even managed a qso
with it using tnctsr-s. But it won't always load, and sometimes, it'll
lock up. Also, when loading, it sometimes tries to resynch the tnc, and
then dumps to the command prompt. SP is an outstanding packet program, and
normally, TNCTSR doesn't give me any problems under DOS. If anyone has
had any experience using tnctsr-s under os2, and knows of some kind of
trick to getting it running, I'd love to hear aout it. Right now, sp is
running in the background in a DOS window out of DOS drive, and after
three tries, it finally loaded. Off of C drive, with os2 on d drive. It's
pretty different, but more than likely, if configured right, tnctsr-s would
have no problem under os2 either. I even had it loaded on d drive to ring
it out, but took it off later, after it wouldn't reload.
P.S. I'm currently using a HAPN-2 card. I don't know if that makes any
difference or not, as it's compatible with the driver

169. Digital Network In Africa

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-09 23:50:44 UTC
From: miniver@panix.com
Message-ID: <3esi4k$fev@panix.com>
Source record: 45300

I have a question. I would like to work in building up electronic communications in Africa and other Third World nations. Is there any one out there who knows who I might want to ask, or where I could go to get more infomation ... like a branch of the Peace Corps, for instance?

Any pertinent information would be really helpful. Thnx.

170. PC clock goofs up software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-10 00:17:31 UTC
From: exuward@exu.ericsson.se
Message-ID: <3esjmr$na2@cnn.exu.ericsson.se>

Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.amateur.space

The clock in our PC gets off about 2 minutes per hour. This causes a problem with the sat. tracking software. Is there a tsr that someone has written to correct this? There is no way to tune the crystal manually on the motherboard.

Thanks in advance,

Jerry Ward.

Hi, I have a very big interest in something I have been hearing about, but know nothing of for a while now..<Grin>

I heard that there is a way to transmit files and data over ham radios? Am I correct?

If so does anyone know of a file or something with info how to get started in this is?

If you have info, I would be very interested in this, since I am in a super rural area, with no local exchanges to speak of, and a great need to save on the LD bill..<G>

Thanks again and I appreciate any help that I might recieve...

A limited number of test sites are needed to test the pre-release version of a new software product aimed at users of Kantronics tncs. Minimum requirements are:

1. One or more Kantronics tncs capable of host mode operation (that's all of the current ones).

2. Current firmware (Kam version 7.1, Kpc-4 version 5.0, etc.).

3. MS-Windows 3.11 or WFWG 3.11 operating environment.

4. Sufficient MS-Windows experience, hardware horsepower, and digital amateur radio experience to be comfortable installing and testing a new windows application (docs, setup and help files are not ready!).

Initial test sites will be determined within the next two weeks. No warranty, compensation or consideration is offered and a non-disclosure agreement may be required. Please respond by email describing your installation, MS-windows experience and typical digital radio operating modes (e.g. vhf packet, rtty, amtor, pactor, G-tor, etc.).

>Eletronics, from Soquet, but it's FCC Class A.

But then you'd need an external TNC, or at least a modem.

More interesting, I think, would be to use a PCMCIA *sound card*, and
do the modem, HDLC, and other TNC functions completely in software.
This could be done either on the host or (for some pcmcia sound cards
that contain programmable DSP's), the modem functions could be
offloaded to the pcmcia card itself.

I have been interested in doing this completely in software
for baseband modulation. I haven't gotten serious about
it yet (I will probably start with simple fsk) but I don't
see any real obstacles, just a lot of grunt programming.

Yes, you can transmit files and data over radio links just as you can over telephone lines. To do it, you need a license from the FCC. The kind of license needed depends upon what you want to transmit. Most of us here have amateur radio licenses which allows us to transmit in the amateur radio bands, but not for commercial purposes. Your best bet would be to contact a local amateur or club in your area.

This is a problem common to all DOS machines. The crux of the problem
is that the PC's hardware clock is only read at boot time (by MS-DOS).
After that the Time-of-Day clock is updated by a software interrupt
which simply adds a clock tic to a counter which is, in fact the TOD
clock. If your system is 100% CPU bound, as it surely is running a sat
tracker, there is little spare time to update the TOD clock. A possible
solution would be to write a TSR to re-read the hardware clock and
update the TOD clock.

Another possible solution is to run your sat tracker under Linux,
Windows NT or OS/2 since they do not suffer from this brain damage.
I run SatTrak 3.8 under Linux and NT with no worries.

Best,

dave

It seems that the poster is into his own WAC pursuit: Is there a Wild-Assed-Comments award? ;-)

Would it not be better to use Phil's comment as an example? He said "I am into communications". That one simple statement explains his position. I did not think it needed any further interpretation or elaboration but maybe it does. Amateur *radio* is a small subset of communications. Phil's aspirations no doubt extend beyond what amateur radio is, or ever will be, capable of delivering. So, does he throw a tantrum and denigrate or demean practically everyone in amateur radio with such statements as listed below? No, he just infers that he has been frustrated so he may pick up his tent and move to another arena that can better accomodate his pursuits.

>your doing and have the proper test equipment to do the alignmet or
>know someone who is able and willing to do the aligning for you.

Gee, tuning up a Motorola or GE radio isn't all that hard. I don't
mean to trivialize it, but it isn't some magic. The key is to have a
service manual for the radio; I've never had a problem ordering the ones
I need from Motorola, but I've heard stories recently of people having
trouble getting older manuals. A Mitrek isn't that old; I had no problem
recently getting the service manuals for a low-band Mitrek (they were even
very inexpensive).

>I was told about the Mitrek and found a couple at the local flea market
>and brought them home... Finding the documenation for the mods and
>doing the actual work was no problem. Then the alignment was needed..
>Well I sure didn't have all the test equipment do do xmtr and rcvr
>alignment on 430 mhz and finding anyone witht he proper test equipment
>wasn't easy.. Then I found a ham who was a Motorola technician and
>had the equipment but didn't have the time..

Hmmm.... most of the radios are pretty easy to align. The only real piece
of test gear required is a signal generator to align the receiver. A VOM
normally suffices for the rest of the gear. The signal generator can be
a 51 ohm resistor on a piece of coax near a low-power HT exciter, but this is
less than optimal.

>For my money, I'll go with the TEKK radios which I now use and if
>you have a Moxie or Mitrek, strip out the PA and use that on the
>back end of the TEKK radio... You'll save yourself a lot of trouble
>in the long run and $100 or so will seem cheap...

I can't believe my ears. It would be harder to attach a Mitrek PA to Tekk
radio than to tune the Tekk radio in the first place, and the Mitrek kicks
the Tekk into the weeds in terms of front-end performance, etc. The Tekk radio
isn't bad, it just isn't on par with a Mitrek. I'm still in disbelief, though,
that you suggest cobbling a Mitrek PA onto a Tekk radio as being easier than
aligning a Mitrek in the first place. What would you do for a T/R switch?
Relays almost certainly would be slower than the PIN switch in the Tekk. That
means you'd probably be host-switching the Tekk, wonder how the Tekk output
would hold up...

If tweaking the receiver is the problem (tweaking a transmitter is usually a
VOM only affair), then save your cash up and buy a used/cheap signal generator!

>If your a technician with the proper test equipment to do the
>alignment, please post such to this group and you will be kept
>busy for years...

In all honesty, if you can't tune your radio up, then pay someone
to do it for you. If you buy a Mitrek for $50, and spend $25 on
rocks and $50 to a shop to align the radio for you (which you should
always do *before* attempting 9600 baud modifications, IMHO), then
the $125 you spend will be a deal in the long run.

From what I've been told, changing the frequency of a Tekk radio can require
a spectrum analyzer to do a decentg job. On the other hand, of all the Motorolas
I've tweaked, only one has ever exhibited a spur, and this was due to significantly
changing the output power setting without a touch-up of the PA tuning.

Those units were used extensively by Canadian amateurs in 10 GHz work.
Anyone familiar with the VE3ONT contest operation and particularly VE3ASO
might be able to help. I didn't realize the US was using them as well.

David M. Upton, WB1CMG

P.S. I will post this on the VHF/UHF reflector out of Stanford to see if anyone
can help. Failing there, I can perhaps suggest people to contact. Good luck.

Andrew:

Are you SURE that all of the distance measuring functions have been disabled? What happens when you try to use it just for voice transmission?

Since I am not familiar with these units I can only give you some clues on where to look for various pieces. Start at the feed horn and work your way back through the waveguide. Eventually you should get to the business end of the unit. The 2 most likely things to find are a gunnplexor type generator or perhaps a klystron. I'm betting these are new enough to have solid state power generation which uses a varactor to modulate the signal.

A solid state generator will be fairly small about 2.5 inches on a side. Look at the signal going to the varactor to see if the 2.7 KHz signal is there. If it is this will let you know that it is inherent in the transmitter and will need to be tracked down and disabled.

This process may take several iterations through this group to help you track down the problem, so don't get discouraged!

189. Re: Packet Repeater Coordination

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-10 19:57:22 UTC
From: jpd@ucs.usl.edu
Message-ID: <3euor2$6ri@rouge.usl.edu>
Source record: 45321
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.policy

I suspect the desire to segregate packet repeaters to certain frequencies was to avoid the problem of the packet transmissions bringing up distant co-channel repeaters during band openings, or distant receivers suddenly hearing packet on a "local" frequency. While understandable for 1200 (2400?) baud packet, I think the problem doesn't exist for 9600 baud packet repeaters. 9600 baud transmissions don't seem to bring up voice repeaters (at least the ones I've tried, by accident of course). I've assumed that the 9600 baud signal has too many high-freq components to open a squelch based on signal quieting. Perhaps coordinating bodies need to revisit the issue as the state of the art creeps forward.

If they aren't giving the executables away, you can be sure they certainly
aren't going to be handing out copies of the source code.

The closest thing to source code available for *any* of this software
TNC thing is Poor Mans Packet which was publised along with the source
code in 73 magazine several years ago.

197. How to recognize digital emission modes in HF?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-11 11:50:12 UTC
From: Rolla@ICO.OLIVETTI.COM
Message-ID: <Rolla.5.0@ICO.OLIVETTI.COM>
Source record: 45329

Greetings to all,
I started one year ago to make SWL on HF with my FRG-100 to decode
digital signals with my PC and my homebrewed decoder.
I succeeded decoding all most known modes as PACKET, CW, RTTY and WEFAX
but I've never succeeded to decode FEC, AMTOR or PACTOR emissions only because
I don't know how to recognize this kind of emission modes.
Maybe I can have heard them, but when going up and down on HF there are a lot
of digital signals that can be heard, that tuning every odd signal heard
becomes a long and wasting time work.
I have some questions:
- can these emissions be identified only earing them ?
- could someone describe me how these emissions sounds to ears ?
- where can I find some infos on the activity of the stations emitting
in these modes (I suppose will be utility stations or HAMS) ?

Generally speaking, I would like to know if it's worth to continue the search
for decoding these emissions or not.

Any help will be appreciated!

Thank anticipately
Best Regards

Claudio Rolla.

This is not entirely correct. It doesn't matter if the machine is CPU bound
100%, the clock will update reliably. This is because the timer tick is
interrupt driven, from the Timer 0 channel, and is sourced by the 14.some_odd
megahertz clock that is used for bus timing, and in the old days, color burst
generation. The problem is someone is leaving interrupts turned off for too
long, and ticks are getting missed. This has NOTHING to do with the machine.
It's all in the code you're running (like any TSRs, heavy serial I/O without
using a 16550 SCC, etc). The only other scenerio that comes to mind is that
perhaps your oscilliator is off, but for that kind of drift, you'd most likely
have other (more severe) problems.

From: durham@lobby.ti.com
Message-ID: <3f14bt$42r@superb.csc.ti.com>
Source record: 45332

Aside from the technical aspect of satellite packet, is there a source of information about commercial TNCs and modems? ... Like is there anyone other than PacCom building completely assembled packet interfaces for satellite use up to 9600 baud? Can a PSK TNC/Modem be bought for less than $200?

I don't want to build any more kits in the near future, but would like to try packet through the microsats.

Does a program exist for a 16 bit sound card that would do all of the packet functions for satellite use? I am presently monitoring VHF packet using my 8 bit Sound Blaster with a program named PKTMON12.

I can't figure out why your KPC-3 would have no internal clock. I thought
it was standard in the new generation Kantronics TNCs. Anyway, Lan-Link
will set the TNC time upon startup, if you set it to do so. There are
many others but this is the one with which I am most familiar. I haven't
seen the latest version in any of the ftp sites I've visited but version
2.20 is around at several ftp sites, such as ftp.ucsd.edu and others.

>I don't know how to recognize this kind of emission modes.

You can find SITOR A and B sigs at 6300 - 6350 Mhz. These are the equivalent
of AMTOR ARQ, and AMTOR FEC respectively. As desribed in another followup
to this, FEC sounds like fast baudot with a musical tone to it. ARQ has a
rhythmic chirping. Anyway if you listen between the above freqs you will
evetually hear one or the other. This is the commercial ship SITOR area
and there is usually traffic there. Also be aware that AMTOR ARQ listen mode
may or may not work real well. You are not in the error correcting loop so
it's hit and miss sometimes.

>Generally speaking, I would like to know if it's worth to continue the search
>for decoding these emissions or not.

Absolutely worth it. I have a great time tuning outside the ham bands and
trying to decode what I find.

: >--
: >-- James Dugal, N5KNX Internet: jpd@usl.edu

: I do agree that FM receivers will probably think 9600 baud
: Packet is noise, and not respond, but it still is RF, and
: has signal blocking capabilities. Further, who wants voice
: interference on a Packet frequency, that reduces throughput?

Hold on here a second. If the Packet repeater is coordinated then
the only "interference" will be from dx systems under enhanced or
anomolous circumstances. So the "interference" should be low enough
that local signals will capture the receiver. That is 99.99% of
the time you will not hear or be bothered by the dx interference.

On those 2 or 3 days a year when enhancement of the sort that will
bother you occurs, the frequency or duty cycle of the transmitters
should reduce the probability even more - ie. if it is a user
terminal interfering with a dx repeater the user (packet terminal)
will have a duty cycle of less than 50% for the period of the
session. If the user terminal is voice the duty cycle will be
even less (you have to unkey periodically or the repeater you
are trying to work will time out - and you have to listen some
of the time;_). If it is a repeater interfering with a dx
user terminal, the local repeater should have a stronger signal
and should capture. As well voice repeaters should be running
CTCSS on the output anyway, and this would totally avoid voice
repeater users from even knowing that there is dx packet in
enhancement.

If a dx voice system is enhanced and being rx'd by the packet
repeater, I think as long as the wanted Carrier to Interference

ratio is better than 10 dB the Packet system should not be
affected. If the dx voice has a stronger signal that the local
packet then packets will stop getting through. (I've never
heard this happen on voice systems before - but there is
probably a small probability that it can occur).

Question: does it really matter to packet if for a few minutes
a couple times a year some enhancement wipes our a few packets?
Does is really matter to voice users if for a few minutes a
couple times a year a few syllables are lost in someones
transmission?

I would bet that other interferences are much more significant -
multipath, adjacent band interference (pagers), and such,
than dx enhancement interference.

: I think that if I was running a Packet repeater, I would prefer
: a Packet only frequency like MACC has provided for.

: 73, Nels....

Nels you're a Television Engineer - how often do your viewers phone
in to complain that a dx TV station is wiping out your station's
signal? (and if they do what do you do? turn up the wick on
your transmitters or go home and fire up 6 meters ;-)

Packet only frequencies would be fine if there was enough of them.
The problem is, that with ATV, and voice repeaters, there isn't
much room left for building and effective "network". With new
data applications like World Wide Web, digital voice, and digital
video with cuseeme, one or two 9600 baud data repeaters don't
serve to many users.

Answer, IMHO, do not limit the number of data/packet frequencies
for digital repeaters.

Will this program (TFPCX.EXE) drive my baycom modem in KISS mode? so I can
run jnos! that would be great. If not is there a driver for the modem to
make it talk in KISS mode?

I think I know the unit, from your description below. someone offered
me a couple, but they were too heavy and power hungry (for the klystron)
to be useful for me.

>There seems to be a very noisy tone present in the transmission, it's
>fundamental is at 2.7kHz but has many harmonics... This is a problem as I
>have built two G3RUH modems (now working perfectly back to back) which
>have data spectrums up to 7.2kHz.

either it's a pilot tone, for tuning, or from the DC-DC converter, as
KH6CP suggested. a scope should tell you if the pwer supply is at this
frequency; if so, filter it better. if not, find the tone generator and
turn it off.

>I have tried, for an experiment, filtering off this 2.7kHz tone with a
>notch filter... But alas, it ate my data! (can be expected really, but
>it was only a try!).. Anyway, transmitting data one way across this link
>results in the received data 'eye' being as closed as... (well, very closed)..

>Also, as these microwave units work in full duplex... The transmitted audio
>(mic) can be heard in the ear!! This is obviously going to confuse the
>modem as it will be hearing its own data as well as the data from the
>communcating modem!!! It seems as though the signal is being 'reflected'
>by the receiving radio as when they are out of tune this signal does
>not get fed back, only white noise is heard then! (Do you see what I mean?)

yes, since they are full duplex, with each transmitter acting as local
oscillator for the receiver, you must hear transmitted audio. however,
since the same problem occurs on a two-wire telephone line, modems
must be able to deal with this. in the telephone world, it's called
echo cancellation, and dealt with either by a "hybrid" transformer or,
in newer equipment, by a chip.

alternately, since you have huge amounts of potential bandwidth to use,
separate the modulation frequencies for the two directions; it doesn't
have to fit in an audio bandwidth at these frequencies. 2 Mbit data
rates are used for 10 GHz amateur data links.

>of the units with a detachable feed horn.
>
>I would very much appreciate it if anyone could forward any cct diagrams
>to me....

this is as close as you will get:

```
Klystron oscillator --> antenna
| X mixer
mike amp |
|
33 MHz FM IF strip
|
audio and DME stuff
```

the mike and audio are an "order wire" so the operators at the two ends
can communicate. I'll bet the pilot tone is part of this, to aid in
tuning the frequency

>In fact.... HHHHHHHEEEEEELLLLLPPPPPP!!!! ;).. 25% of my degree is resting
>on this project! (Well 25% of my final year anyway).

good luck. If you do pull it off and are looking for a job in data
communications, send a resume.

Source record: 45265

Ok, I've read the manual many times:

1. Does the MFJ-1272 will do the trick? By looking at the pictures it
looks that might do the trick, however there is an R(s) which has to
be determined if you're doing the interface box by yourself. However, MFJ
sells the 1272 which is a pre-built interface. Will it work
with the HTX-202?

2. BTW, how do you minimize the noise that comes from the computer????

73,

>Answer, IMHO, do not limit the number of data/packet frequencies
>for digital repeaters.

And here is the heart of the matter. I see the MACC selection of 3 data frequencies as a cop out. Frequency coordinating bodies have in the past, and continue today to be centered around FM voice repeaters. This is not to say that some coordination councils go farther, or care more, but the responses I've seen in general do not REALLY address the other modes.

What I see is a council declaring that it has set aside a few frequencies so that "they" (the packet folks) can figure out for themselves how to use the frequencies and divvy them up on their own. It would seem to me that the same coordination methods employed for a voice repeater would apply for a data repeater, and each have an equal claim to ANY frequency pair which exists, and each should receive equal amounts of help from the frequency coordinator for the band in question.

Coordination councils need to pay more than lip service to the FM simplex, weak signal and data users of the bands. All of these uses have concerns, and the coordination councils should respect and actively embrace the needs of all.

Message-ID: <zxmli05-120195191437@zxmli05.student.uni-tuebingen.de>
Source record: 45345

Dear rec.radio.amateur.digital.misc Readers,

Buried under FAQs and info from 12 hours of searching through the net for digital ham modems, etc and connecting it to a Macintosh, I've failed to find anything specifically helpful for my very specific questions.

My Questions:

If there is anyone running a Mac on the Internet via SLIP via digital ham: what equipment and software are you using? how much did it cost? is anyone doing ham modem TCP/IP connections to the Internet with digital ham in Europe? What Internet Providers exist for Internet via SLIP via TCP/IP via Ham Radio Server?

If these questions are too amateurish or in your opinion band-width waste, please forgive me.

Sincerely,

Shaughn Daniel <zxmli05@student.uni-tuebingen.de>

>Ham Radio Server?

Unfortunately in the USA we are not allowed to have unmonitored gateways's
between the internet and amateur radio networks (AMPRnet). US hams can
set up such gateways, but they are then responsible for all data that
crosses them. Most hams won't take the resposability and possability of
lossing their liscense for a project like this.

But there are still some gateways in operation. The software use is called
NOS (NetMAC for the macintosh) and it supports SLIP and ax25 and several
other protocols. (ftp it from ftp.ucsd.edu)

With this software you can connect your mac to a SLIP line and/or a TNC.
To make a gateway you would need one computer with both a SLIP connection
to the internet and a TNC and radio to communicate over the amateur bands.
With this operating you could then send data to the internet from a computer
which only has a TNC/radio connection.

It sounds simple, but depending on your local laws it can be a problem
to operate. It is also not a simple thing to set up in terms of configuring
the gateway. You really need to understand TCP/IP and IP routing well before
you should attempt to set something like this up. I do not know if any
documentation has ever been written on doing this, but in the USA a good
place to start looking would be in the ARRL's Computer Networking Conference
papers.

I don't have any information on SLIP providers.

Another thing that is being done is "wormholes". A gateway in the USA
can send amateur data to another gateway in another part of the world.
The two "ends" of this wormhole then appear to be very close to eachother.

In the New York City area there are several of these wormholes to
the UK, our west coast, and I think to Germany. I don't use them so I'm not
really sure where there are or where they go.

Hope this helps.

Hi,

Has anybody had any success with these AX.25 patches for Linux? I've
gotten ahold of the AX25012 version. I'm currently running the 1.0.9
Linux kernel.

My question is, how do I get it patched in? I tried
patch -p0 < AX25012 (yes, I already had decompressed it)
but it says it can't find a patch in the file. What am I missing?

73 and thanks,
Chris

amateur radio gets to do a lot of stuff in the radio technical world in
exchange for content restrictions (language, commercial use, etc.)
that's a problem with an unrestricted gateway into the amateur world
from the conventional world of the internet.

there probably should be some consideration of "loosening" the rules some
more, but in the US efforts are currently falling on deaf ears for now.
(I think it's going to take another 2-3 years, phil...i also have to say
i wasn't even aware of your petition for reconsideration ... been too
busy with things here to do some serious keeping up with such points..
sorry about that...ka9q de wb9ivr..)
>
>If these questions are too amateurish or in your opinion band-width waste,
>please forgive me.

no, not really -- you're yet another person that would like to do a serious
internet style net over radio, but you're currently blocked from doing this
by the content and commercial use rules common in amateur radio. doesn't
mean you shouldn't consider getting an amateur radio license and working
toward getting rid of the barriers that have kept amateur radio in the
backwaters of communications development in the last half of the 20th
century.

(at one time, not all that long ago in the United States, we had to use
60 WPM 5-level teletype..no ASCII transmissions...(would those printer
pictures count as binary data?? probably..)

222. Linux, Packet, and multiple TNCs?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-13 13:04:59 UTC
From: stroup@gauss.usafa.af.mil
Message-ID: <3f618f$kjp@usafa2.usafa.af.mil>
Source record: 45353

To all:
Here is a question for all of you HAMs who are Linux
gurus...

Is it possible to use Linux, and the AX.25 software that
is available, to control up to 4 TNCs on the same machine?

I am currently running a 386DX/40 MHz machine using
DOS and WNOS. The machine has a multi COM port board, so that
there are four distinct COM ports (also has 3 parallel ports). I have
connected to these COM ports the following:

COM 1 Baycom TNC -> HTX-202
COM 2 Baycom TNC -> Icom 2AT
COM 3 KPC 9612 -> Kenwood TM-241
COM 4 KPC-3 -> Icom 25A

Also, this machine has an SMC Ultra-Elite network card
that I would like to be able to use to network to the other machines
at my house. I am having some memory problems using DOS and WNOS,
and wanted to find a more "stable" platform to run packet on. Is it possible
to accomplish this, or am I a hopeless dreamer?

From: durham@lobby.ti.com
Message-ID: <3f6k7q$h9u@superb.csc.ti.com>
Source record: 45358

Several e-mail requests for the site to obtain this software prompt me
to post the following:

The Creative Labs Soundblaster boards (both 8 bit and 16 bit) can be
used to monitor packet transmissions on HF and VHF. The program name
is PKTMON12 and it is available from ftp.funet.fi/pub/ham/packet/misc
as PKTMON12.LZH. The LZH is a compression scheme similar to ZIP and
you will need to get a copy from your freeware source to uncompress
the program.

The program is receive only and error free to a file. The screen copy
is real time, but is not error free and not organized. I use it unattended
and look at the files at my convenience.

Well, Clay, after you've hammered on Phil Karn and told him to "go away!",
you then seem to compliment the rec.radio.amateur.digital.misc group
for being problem solvers.

It is fair to point out that Phil Karn, KA9Q, has been one the strongest
contributors in the last decade to amateur digital communications. It is
also fair to point out that Phil also happens to work in radio communications.

Mind you, I said "radio communications".

Attempting to drive away those people that would advance "radio communications",
even "digital radio communications", because it doesn't fit your model of
what amateur radio should be, strikes me as a rather "preachy" thing to do.
Telling Phil Karn off because he argues for progress seems to be a bit of
a rant, too.

Now, rec.radio.amateur.digital.misc may be a better place to try and
convince the readership that high-speed digital communications, even
56kb, doesn't belong in amateur radio. So, go at it, rant about
how hams have no place aspiring to build high speed data networks
via radio. ;-)

: Linux kernel.

Yes. There are links to HOWTOS on my web page, see below. My
Buddie, KA9KIM does have it up and running, but is having problems
with it being REALLY slow. (waiting a minute to send a packet).
still working on getting all the bugs out of his installation.

he's at msims@grfn.org

: Jerry Ward.
first of all let me suggest you look at the october 93 issue of
BYTE magazine, page 57 article "Keeping Time on Your PC" by Michael Lombardi.
this article addresses keeping time on your pc (DOH!) but also gets into
the accuracy of a pc real time clock. According to the article
the pc clock will generate a interrupt every 54.936 msecs and count these.
Now it can only display multiples of this value so you miss some times.
Thus it drifts 1 to 15 seconds per day with 5 to 6 seconds per day being
typical.

There is also a I'net site listed for some code and info on this
its 132.163.135.130 and you can ftp to it to get program code and such.
I looked at this code awhile ago but never used it.

My personal story is this, i was trying to set the pc clock using a GPS
receiver so that we could keep accurate time with the pc's and synchronize
multiple pc's. This never happened, i had to write some C code to constantly
read the gps time and keep it as the reference (kinda sucks) anyway, if you
really need a accurate clock in your pc i suggest you talk to some of the
companies that sell accurate clocks for the pc that replace the old RTC with
a plug in card and you can even connect this to a GPS receiver to keep it
completely accurate. Such a company is datum, inc try emailing them
at datum.com

also, note that the problem with the clock is based on the accuracy of the
RTC and the bios of the system so it is my impression that this problem
would prevail on any pc, unless you write some code to correct the offset
(which such code is on the above ftp site)

best of luck,
jess

ps the ip address above is alos time_a.timefreq.bldrdoc.gov (hey who better
to get correct time from than NIST?)

AX.25 Amateur Packet-Radio Link-Layer Protocol
Version 2.0 October 1984

2. AX.25 Link-Layer Protocol Specification

2.1 Scope and Field of Operation

In order to provide a mechanism for the reliable
transport of data between two signaling terminals, it is
necessary to define a protocol that can accept and deliver data
over a variety of types of communications links. The AX.25 Link-
Layer Protocol is designed to provide this service, independent
of any other level that may or may not exist.

This protocol conforms to ISO Recommendations 3309, 4335
(including DAD 1&2) and 6256 high-level data link control (HDLC)
and uses some terminology found in these documents. It also
conforms with ANSI X3.66, which describes ADCCP, balanced mode.

This protocol follows, in principle, the CCITT X.25
Recommendation, with the exception of an extended address field
and the addition of the Unnumbered Information (UI) frame. It
also follows the principles of CCITT Recommendation Q.921 (LAPD)
in the use of multiple links, distinguished by the address field,
on a single shared channel.

As defined, this protocol will work equally well in
either half- or full-duplex Amateur Radio environments.

This protocol has been designed to work equally well for direct connections between two individual amateur packet-radio stations or an individual station and a multiport controller.

This protocol allows for the establishment of more than one link-layer connection per device, if the device is so capable.

This protocol does not prohibit self-connections. A self-connection is considered to be when a device establishes a link to itself using its own address for both the source and destination of the frame.

Most link-layer protocols assume that one primary (or master) device (generally called a DCE, or data circuit-terminating equipment) is connected to one or more secondary (or slave) device(s) (usually called a DTE, or data terminating equipment). This type of unbalanced operation is not practical in a shared-RF Amateur Radio environment. Instead, AX.25 assumes that both ends of the link are of the same class, thereby eliminating the two different classes of devices. The term DXE is used in this protocol specification to describe the balanced type of device found in amateur packet radio.

2.2 Frame Structure

Link layer packet radio transmissions are sent in small blocks of data, called frames. Each frame is made up of several smaller groups, called fields. Fig.1 shows the three basic types of frames. Note that the first bit to be transmitted is on the left side.

First
Bit Sent

Flag Address Control FCS Flag
01111110 112/560 Bits 8 Bits 16 Bits 01111110

Fig. 1A -- U and S frame construction

First
Bit Sent

Flag Address Control PID Info. FCS Flag
01111110 112/560 Bits 8 Bits 8 Bits N*8 Bits 16 Bits 01111110

Fig. 1B -- Information frame construction

Each field is made up of an integral number of octets (or bytes), and serves a specific function as outlined below.

2.2.1 Flag Field

The flag field is one octet long. Since the flag is used to delimit frames, it occurs at both the beginning and end of each frame. Two frames may share one flag, which would denote

the end of the first frame, and the start of the next frame. A flag consists of a zero followed by six ones followed by another zero, or 01111110 (7E hex). As a result of bit stuffing (see 2.2.6, below), this sequence is not allowed to occur anywhere else inside a complete frame.

2.2.2 Address Field

The address field is used to identify both the source of the frame and its destination. In addition, the address field contains the command/response information and facilities for level 2 repeater operation.

The encoding of the address field is described in 2.2.13.

2.2.3 Control Field

The control field is used to identify the type of frame being passed and control several attributes of the level 2 connection. It is one octet in length, and its encoding is discussed in 2.3.2.1, below.

2.2.4 PID Field

The Protocol Identifier (PID) field shall appear in information frames (I and UI) only. It identifies what kind of layer 3 protocol, if any, is in use.

The PID itself is not included as part of the octet count of the information field. The encoding of the PID is as follows:

M L
S S
B B
yy01yyyy AX.25 layer 3 implemented.
yy10yyyy AX.25 layer 3 implemented.
11001100 Internet Protocol datagram layer 3 implemented.
11001101 Address resolution protocol layer 3 implemented.
11110000 No layer 3 implemented.
11111111 Escape character. Next octet contains more Level 3 protocol information.

Where:

A y indicates all combinations used.

Note:

All forms of yy11yyyy and yy00yyyy other than those listed above are reserved at this time for future level 3 protocols. The assignment of these formats is up to amateur agreement. It is recommended that the creators of level 3 protocols contact the ARRL Ad Hoc Committee on Digital Communications for suggested encodings.

2.2.5 Information Field

The information field is used to convey user data from one end of the link to the other. I fields are allowed in only three types of frames: the I frame, the UI frame, and the FRMR frame. The I field can be up to 256 octets long, and shall contain an integral number of octets. These constraints apply prior to the insertion of zero bits as specified in 2.2.6, below. Any information in the I field shall be passed along the link transparently, except for the zero-bit insertion (see 2.2.6) necessary to prevent flags from accidentally appearing in the I field.

2.2.6 Bit Stuffing

In order to assure that the flag bit sequence mentioned above doesn't appear accidentally anywhere else in a frame, the sending station shall monitor the bit sequence for a group of five or more contiguous one bits. Any time five contiguous one bits are sent the sending station shall insert a zero bit after the first one bit. During frame reception, any time five contiguous one bits are received, a zero bit immediately following five one bits shall be discarded.

2.2.7 Frame-Check Sequence

The frame-check sequence (FCS) is a sixteen-bit number calculated by both the sender and receiver of a frame. It is used to insure that the frame was not corrupted by the medium used to get the frame from the sender to the receiver. It shall be calculated in accordance with ISO 3309 (HDLC) Recommendations.

2.2.8 Order of Bit Transmission

With the exception of the FCS field, all fields of an AX.25 frame shall be sent with each octet's least-significant bit first. The FCS shall be sent most-significant bit first.

2.2.9 Invalid Frames

Any frame consisting of less than 136 bits (including the opening and closing flags), not bounded by opening and closing flags, or not octet aligned (an integral number of octets), shall be considered an invalid frame by the link layer. See also 2.4.4.4, below.

2.2.10 Frame Abort

If a frame must be prematurely aborted, at least fifteen contiguous ones shall be sent with no bit stuffing added.

2.2.11 Interframe Time Fill

Whenever it is necessary for a DXE to keep its transmitter on while not actually sending frames, the time

between frames should be filled with contiguous flags.

2.2.12 Link Channel States

Not applicable.

2.2.13 Address-Field Encoding

The address field of all frames shall be encoded with
both the destination and source amateur call signs for the frame.
Except for the Secondary Station Identifier (SSID), the address
field should be made up of upper-case alpha and numeric ASCII
characters only. If level 2 amateur "repeaters" are to be used,
their call signs shall also be in the address field.

The HDLC address field is extended beyond one octet by
assigning the least-significant bit of each octet to be an
"extension bit". The extension bit of each octet is set to zero,
to indicate the next octet contains more address information, or
one, to indicate this is the last octet of the HDLC address
field. To make room for this extension bit, the amateur Radio
call sign information is shifted one bit left.

2.2.13.1 Nonrepeater Address-Field Encoding

If level 2 repeaters are not being used, the address
field is encoded as shown in Fig. 2. The destination address is
the call sign and SSID of the amateur radio station to which the
frame is addressed, while the source address contains the amateur
call sign and SSID of the station that sent the frame. These
call signs are the call signs of the two ends of a level 2 AX.25
link only.

First
Octet Sent

Address Field of Frame
Destination Address Source Address
A1 A2 A3 A4 A5 A6 A7 A8 A9 A10 A11 A12 A13 A14

Fig. 2 -- Nonrepeater Address-Field Encoding

A1 through A14 are the fourteen octets that make up the
two address subfields of the address field. The destination
subaddress is seven octets long (A1 thru A7), and is sent first.
This address sequence provides the receivers of frames time to
check the destination address subfield to see if the frame is
addressed to them while the rest of the frame is being received.
The source address subfield is then sent in octets A8 through
A14. Both of these subfields are encoded in the same manner,
except that the last octet of the address field has the HDLC
address extension bit set.

There is an octet at the end of each address subfield
that contains the Secondary Station Identifier (SSID). The SSID
subfield allows an Amateur Radio operator to have more than one
packet-radio station operating under the same call sign. This is
useful when an amateur wants to put up a repeater in addition to
a regular station, for example. The C bits (see 2.4.1.2, below)
and H bit (see 2.2.13.2, below) are also contained in this octet,
along with two bits which are reserved for future use.

Fig. 3A shows a typical AX.25 frame in the nonrepeater
mode of operation.

Bit Position--> 76543210
```

Fig. 3 -- Destination Field Encoding

Where:

1. The top octet (A1) is the first octet sent, with bit 0 of each octet being the first bit sent, and bit 7 being the last bit sent.

2. The first (low-order or bit 0) bit of each octet is the HDLC address extension bit, which is set to zero on all but the last octet in the address field, where it is set to one.

3. The bits marked "r" are reserved bits. They may be used in an agreed-upon manner in individual networks. When not implemented, they should be set to one.

4. The bit marked "C" is used as the command/response bit of an AX.25 frame, as outlined in 2.4.1.2 below.

5. The characters of the call sign should be standard seven-bit ASCII (upper case only) placed in the leftmost seven bits of the octet to make room for the address extension bit. If the call sign contains fewer than six characters, it should be padded with ASCII spaces between the last call sign character and the SSID octet.

6. The 0000 SSID is reserved for the first personal AX.25 station. This establishes one standard SSID for "normal" stations to use for the first station.

2.2.13.2 Level 2 Repeater-Address Encoding

If a frame is to go through level 2 amateur packet repeater(s), there is an additional address subfield appended to the end of the address field. This additional subfield contains the call sign(s) of the repeater(s) to be used. This allows more than one repeater to share the same RF channel. If this subfield exists, the last octet of the source subfield has its address extension bit set to zero, indicating that more address-field data follows. The repeater-address subfield is encoded in the same manner as the destination and source address subfields, except for the most-significant bit in the last octet, called the "H" bit. The H bit is used to indicate whether a frame has been repeated or not.

In order to provide some method of indicating when a frame has been repeated, the H bit is set to zero on frames going to a repeater. The repeater will set the H bit to one when the frame is retransmitted. Stations should monitor the H bit, and discard any frames going to the repeater (uplink frames), while operating through a repeater. Fig. 4 shows how the repeater-address subfield is encoded. Fig. 4A is an example of a complete frame after being repeated.

Where:

1. The top octet is the first octet sent, with bit 0 being sent first and bit 7 sent last of each octet.

2. As with the source and destination address subfields discussed above, bit 0 of each octet is the HDLC address extension bit, which is set to zero on all but the last address octet, where it is set to one.

3. The "R" bits are reserved in the same manner as in the source and destination subfields.

4. The "H" bit is the has-been-repeated bit. It is set to zero whenever a frame has not been repeated, and set to one by the repeater when the frame has been repeated.

Fig. 4A -- AX.25 frame in repeater mode

The above frame is the same as Fig. 3A, except for the addition of a repeater-address subfield (WB4JFI, SSID=1). The H bit is set, indicating this is from the output of the repeater.

2.2.13.3 Multiple Repeater Operation

The link-layer AX.25 protocol allows operation through more than one repeater, creating a primitive frame routing mechanism. Up to eight repeaters may be used by extending the repeater-address subfield. When there is more than one repeater address, the repeater address immediately following the source address subfield will be considered the address of the first repeater of a multiple-repeater chain. As a frame progresses through a chain of repeaters, each successive repeater will set the H bit (has-been-repeated bit) in its SSID octet, indicating that the frame has been successfully repeated through it. No other changes to the frame are made (except for the necessary recalculation of the FCS). The destination station can determine the route the frame took to each it by examining the address field.

The number of repeater addresses is variable. All but the last repeater address will have the address extension bits of all octets set to zero, as will all but the last octet (SSID octet) of the last repeater address. The last octet of the last repeater address will have the address extension bit set to one, indicating the end of the address field.

It should be noted that various timers (see 2.4.7, below) may have to be adjusted to accommodate the additional delays encountered when a frame must pass through a multiple-repeater chain, and the return acknowledgement must travel through the same path before reaching the source device.

It is anticipated that multiple-repeater operation is a temporary method of interconnecting stations over large distances until such time that a layer 3 protocol is in use. Once this layer 3 protocol becomes operational, repeater chaining should be phased out.

2.3 Elements of Procedure

2.3.1
The elements of procedure are defined in terms of actions that occur on receipt of frames.

2.3.2 Control-Field Formats and State Variables

2.3.2.1 Control-Field Formats

The control field is responsible for identifying the type of frame being sent, and is also used to convey commands and responses from one end of the link to the other in order to maintain proper link control.

The control fields used in AX.25 use the CCITT X.25 control fields for balanced operation (LAPB), with an additional control field taken from ADCCP to allow connectionless and round-table operation.

There are three general types of AX.25 frames. They are the Information frame (I frame), the Supervisory frame (S frame), and the Unnumbered frame (U frame). Fig. 5 shows the basic format of the control field associated with these types of frames.

Control-Field Control-Field Bits
Type 7 6 5 4 3 2 1 0

I Frame N(R) P N(S) 0
S Frame N(R) P/F S S 0 1
U Frame M M M P/F M M 1 1

Fig. 5 -- Control-field formats

Where:

1. Bit 0 is the first bit sent and bit 7 is the last bit sent of the control field.

2. N(S) is the send sequence number (bit 1 is the LSB).

3. N(R) is the receive sequence number (bit 5 is the LSB).

4. The "S" bits are the supervisory function bits, and their encoding is discussed in 2.3.4.2.

5. The "M" bits are the unnumbered frame modifier bits and their encoding is discussed in 2.3.4.3.

6. The P/F bit is the Poll/Final bit. Its function is described in 2.3.3. The distinction between command and response, and therefore the distinction between P bit and F bit, is made by addressing rules discussed in 2.4.1.2.

2.3.2.1.1 Information-Transfer Format

All I frames have bit 0 of the control field set to zero. N(S) is the sender's send sequence number (the send sequence number of this frame). N(R) is the sender's receive sequence number (the sequence number of the next expected received frame). These numbers are described in 2.3.2.4. In addition, the P/F bit is to be used as described in 2.4.2.

2.3.2.1.2 Supervisory Format

Supervisory frames are denoted by having bit 0 of the control field set to one, and bit 1 of the control field set to zero. S frames provide supervisory link control such as acknowledging or requesting retransmission of I frames, and link-level window control. Since S frames do not have an information field, the sender's send variable and the receiver's receive variable are not incremented for S frames. In addition, the P/F bit is used as described in 2.4.2.

2.3.2.1.3 Unnumbered Format

Unnumbered frames are distinguished by having both bits 0 and 1 of the control field set to one. U frames are responsible for maintaining additional control over the link beyond what is accomplished with S frames. They are also responsible for establishing and terminating link connections. U frames also allow for the transmission and reception of information outside of the normal flow control. Some U frames may contain information and PID fields. The P/F bit is used as described in 2.4.2.

2.3.2.2 Control-Field Parameters

2.3.2.3 Sequence Numbers

Every AX.25 I frame shall be assigned, modulo 8, a sequential number from 0 to 7. This will allow up to seven outstanding I frames per level 2 connection at a time.

2.3.2.4 Frame Variables and Sequence Numbers

2.3.2.4.1 Send State Variable V(S)

The send state variable is a variable that is internal to the DXE and is never sent. It contains the next sequential number to be assigned to the next transmitted I frame. This variable is updated upon the transmission of each I frame.

2.3.2.4.2 Send Sequence Number N(S)

The send sequence number is found in the control field of all I frames. It contains the sequence number of the I frame being sent. Just prior to the transmission of the I frame, N(S) is updated to equal the send state variable.

2.3.2.4.3 Receive State Variable V(R)

The receive state variable is a variable that is internal to the DXE. It contains the sequence number of the next expected received I frame. This variable is updated upon the reception of an error-free I frame whose send sequence number equals the present received state variable value.

2.3.2.4.4 Received Sequence Number N(R)

The received sequence number is in both I and S frames. Prior to sending an I or S frame, this variable is updated to equal that of the received state variable, thus implicitly acknowledging the proper reception of all frames up to and including N(R)-1.

2.3.3 Functions of Poll/Final (P/F) Bit

The P/F bit is used in all types of frames. It is used in a command (poll) mode to request an immediate reply to a frame. The reply to this poll is indicated by setting the response (final) bit in the appropriate frame. Only one outstanding poll condition per direction is allowed at a time. The procedure for P/F bit operation is described in 2.4.2.

2.3.4 Control Field Coding for Commands and Responses

The following commands and responses, indicated by their control field encoding, are to be use by the DXE:

2.3.4.1 Information Command Frame Control Field

The function of the information (I) command is to transfer across a data link sequentially numbered frames containing an information field.

The information-frame control field is encoded as shown in Fig. 6. These frames are sequentially numbered by the N(S) subfield to maintain control of their passage over the link-layer connection.

Control Field Bits
7 6 5 4 3 2 1 0
N(R) P N(S) 0

Fig. 6 -- I frame control field

2.3.4.2 Supervisory Frame Control Field

The supervisory frame control fields are encoded as shown
in Fig. 7.

Control Field Bits 7 6 5 4 3 2 1 0
Receive Ready RR N(R) P/F 0 0 0 1
Receive Not Ready RNR N(R) P/F 0 1 0 1
Reject REJ N(R) P/F 1 0 0 1

Fig. 7 -- S frame control fields

The Frame identifiers:

C or SABM Layer 2 Connect Request
D or DISC Layer 2 Disconnect Request
I Information Frame
RR Receive Ready. System Ready To Receive
RNR or NR Receive Not Ready. TNC Buffer Full
RJ or REJ Reject Frame. Out of Sequence or Duplicate
FRMR Frame Reject. Fatal Error
UI Unnumbered Information Frame. "Unproto"
DM Disconnect Mode. System Busy or Disconnected.

2.3.4.2.1 Receive Ready (RR) Command and Response

Receive Ready is used to do the following:

1. to indicate that the sender of the RR is now able to
receive more I frames.

2. to acknowledge properly received I frames up to, and
including N(R)-1, and

3. to clear a previously set busy condition created by an RNR
command having been sent.

The status of the DXE at the other end of the link can be
requested by sending a RR command frame with the P-bit set to
one.

2.3.4.2.2 Receive Not Ready (RNR) Command and Response

Receive Not Ready is used to indicate to the sender of I
frames that the receiving DXE is temporarily busy and cannot
accept any more I frames. Frames up to N(R)-1 are acknowledged.
Any I frames numbered N(R) and higher that might have been caught
between states and not acknowledged when the RNR command was sent
are not acknowledged.

The RNR condition can be cleared by the sending of a UA,
RR, REJ, or SABM frame.

The status of the DXE at the other end of the link can be
requested by sending a RNR command frame with the P bit set to
one.

2.3.4.2.3 Reject (REJ) Command and Response

The reject frame is used to request retransmission of I frames starting with N(R). Any frames that were sent with a sequence number of N(R)-1 or less are acknowledged. Additional I frames may be appended to the retransmission of the N(R) frame if there are any.

Only one reject frame condition is allowed in each direction at a time. The reject condition is cleared by the proper reception of I frames up to the I frame that caused the reject condition to be initiated.

The status of the DXE at the other end of the link can be requested by sending a REJ command frame with the P bit set to one.

2.3.4.3 Unnumbered Frame Control Fields

Unnumbered frame control fields are either commands or responses.

Fig. 8 shows the layout of U frames implemented within this protocol.

Control Field Type Control Field Bits
7 6 5 4 3 2 1 0

Set Asynchronous Balanced Mode-SABM Cmd 0 0 1 P 1 1 1 1
Disconnect-DISC Cmd 0 1 0 P 0 0 1 1
Disconnected Mode-DM Res 0 0 0 F 1 1 1 1
Unnumbered Acknowledge-UA Res 0 1 1 F 0 0 1 1
Frame Reject-FRMR Res 1 0 0 F 0 1 1 1
Unnumbered Information-UI Either 0 0 0 P/F 0 0 1 1

Fig. 8 -- U frame control fields

2.3.4.3.1 Set Asynchronous Balanced Mode (SABM) Command

The SABM command is used to place 2 DXEs in the asynchronous balanced mode. This is a balanced mode of operation known as LAPB where both devices are treated as equals.

Information fields are not allowed in SABM commands. Any outstanding I frames left when the SABM command is issued will remain unacknowledged.

The DXE confirms reception and acceptance of a SABM command by sending a UA response frame at the earliest opportunity. If the DXE is not capable of accepting a SABM command, it should respond with a DM frame if possible.

2.3.4.3.2 Disconnect (DISC) Command

The DISC command is used to terminate a link session between two stations. No information field is permitted in a DISC command frame.

Prior to acting on the DISC frame, the receiving DXE confirms acceptance of the DISC by issuing a UA response frame at its earliest opportunity. The DXE sending the DISC enters the disconnected state when it receives the UA response.

Any unacknowledged I frames left when this command is acted upon will remain unacknowledged.

2.3.4.3.3 Frame Reject (FRMR) Response

2.3.4.3.3.1
The FRMR response frame is sent to report that the receiver of a frame cannot successfully process that frame and that the error condition is not correctable by sending the offending frame again. Typically this condition will appear when a frame without an FCS error has been received with one of the following conditions:

1. The reception of an invalid or not implemented command or response frame.

2. The reception of an I frame whose information field exceeds the agreed-upon length. (See 2.4.7.3, below.)

3. The reception of an improper N(R). This usually happens when the N(R) frame has already been sent and acknowledged, or when N(R) is out of sequence with what was expected.

4. The reception of a frame with an information field where one is not allowed, or the reception of a U or S frame whose length is incorrect. Bits W and Y described in 2.3.4.3.3.2 should both be set to one to indicate this condition.

5. The reception of a supervisory frame with the F bit set to one, except during a timer recovery condition (see 2.4.4.9), or except as a reply to a command frame sent with the P bit set to one. Bit W (described in 2.3.4.3.3.2) should be set to one.

6. The reception of an unexpected UA or DM response frame. Bit W should be set to one.

7. The reception of a frame with an invalid N(S). Bit W should be set to one.

An invalid N(R) is defined as one which points to an I frame that previously has been transmitted and acknowledged, or an I frame which has not been transmitted and is not the next sequential I frame pending transmission.

An invalid N(S) is defined as an N(S) that is equal to the last transmitted N(R)+k and is equal to the received state variable V(R), where k is the maximum number of outstanding information frames as defined in 2.4.7.4 below.

An invalid or not implemented command or response is defined as a frame with a control field that is unknown to the receiver of this frame.

2.3.4.3.3.2
When a FRMR frame is sent, an information field is added to the frame that contains additional information indicating where the problem occurred. This information field is three octets long and is shown in Fig. 9.

Information Field Bits
23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 0 0 0 Z Y X W V(R) C V(S) 0 Rejected Frame
R Control Field

Fig. 9 -- FRMR frame information field

Where:

1. The rejected frame control field carries the control field of the frame that caused the reject condition. It is in bits 0-7 of the information field.

2. V(S) is the current send state variable of the device reporting the rejection (bit 9 is the low bit).

3. The CR bit is set to zero to indicate the rejected frame was a command, or one if it was a response.

4. V(R) is the current receive state variable of the device reporting rejection (bit 13 is the low bit).

5. If W is set to 1, the control field received was invalid or not implemented.

6. If X is set to 1, the frame that caused the reject condition was considered invalid because it was a U or S frame that had an information field that is not allowed. Bit W must be set to 1 in addition to the X bit.

7. If Y is set to 1, the control field received and returned in bits exceeded the maximum allowed under this recommendation in 2.4.7.3, below.

8. If A is set to 1, the control field received and returned in bits 1 to 8 contained an invalid N(R).

9. Bits 8, and 20 to 23 are set to 0.

2.3.4.3.4 Unnumbered Acknowledge (UA) Response

The UA response frame is sent to acknowledge the reception and acceptance of a SABM or DISC command frame. A received command is not actually processed until the UA response frame is sent. Information fields are not permitted in a UA frame.

2.3.4.3.5 Disconnected Mode (DM) Response

The disconnected mode response is sent whenever a DXE receives a frame other than a SABM or UI frame while in a disconnected mode. It is also sent to request a set mode command, or to indicate it cannot accept a connection at the moment. The DM response does not have an information field.

Whenever a SABM frame is a received, and it is determined that a connection is not possible, a DM frame shall be sent. This will indicate that the called station cannot accept a connection at that time.

While a DXE is in the disconnected mode, it will respond to any command other than a SABM or UI frame with a DM response with the P/F bit set to 1.

2.3.4.3.6 Unnumbered Information (UI) Frame

The Unnumbered Information frame contains PID and information fields and is used to pass information along the link outside the normal information controls. This allows information fields to go back and forth on the link bypassing flow control. Since these frames are not acknowledgeable, if one gets obliterated, there is no way to recover it. A received UI frame with the P bit set shall cause a response to be transmitted. This response shall be a DM frame when in the disconnected state or a RR (or RNR, if appropriate) frame in the information transfer state.

2.3.5 Link Error Reporting and Recovery

There are several link-layer errors that are recoverable without terminating the connection. These error situations may occur as a result of malfunctions within the DXE, or if transmission errors occur.

2.3.5.1 DXE Busy Condition

When a DXE becomes temporarily unable to receive I frames, such as when receive buffers are full, it will send a Receive Not Ready (RNR) frame. This informs the other DXE that this DXE cannot handle any more I frames at the moment. This condition is usually cleared by the sending of a UA, RR, REJ, or SABM command frame.

2.3.5.2 Send Sequence Number Error

If the send sequence number, N(S), of an otherwise error-free received frame does not match the receive state variable, V(R), a send sequence error has occurred, and the information field will be discarded. The receiver will not acknowledge this frame, or any other I frames, until N(S) matches V(R).

The control field of the erroneous I frame(s) will be accepted so that link supervisory functions such as checking the P/F bit can still be performed. Because of this updating, the retransmitted I frame may have an updated P bit and N(R).

2.3.5.3 Reject (REJ) Recovery

REJ is used to request a retransmission of I frames following the detection of a N(S) sequence error. Only one outstanding "sent REJ" condition is allowed at a time. This condition is cleared when the requested I frame has been received.

A DXE receiving the REJ command will clear the condition by resending all outstanding I frames (up to the window size), starting with the one indicated in N(R) of the REJ frame.

2.3.5.4 Time-out Error Recovery

2.3.5.4.1 T1 Timer Recovery

If a DXE, due to a transmission error, does not receive (or receives and discards) a single I frame or the last I frame in a sequence of I frames, it will not detect a send-sequence-number error, and therefore will not transmit a REJ. The DXE which transmitted the unacknowledged I frame(s) shall, following the completion of time-out period T1, take appropriate recovery action to determine when I frame retransmission should begin as described in 2.4.4.9, below. This condition is cleared by the reception of an acknowledgement for the sent frame(s), or by the link being reset. See 2.4.6.

2.3.5.4.2 Timer T3 Recovery

Timer T3 is used to assure the link is still functional during periods of low information transfer. Whenever T1 is not running (no outstanding I frames), T3 is used to periodically poll the other DXE of a link. When T3 times out, a RR or RNR frame is transmitted as a command and with the P bit set. The waiting acknowledgement procedure (2.4.4.9, below) is then executed.

2.3.5.5 Invalid Frame or FCS Error

If an invalid frame is received, or a frame is received with an FCS error, that frame will be discarded with no action taken.

2.3.5.6 Frame Rejection Condition

A frame rejection condition occurs when an otherwise error-free frame has been received with one of the conditions listed in 2.3.4.3.3 above.

Once a rejection error occurs, no more I frames are accepted (except for the examination of the P/F bit) until the error is resolved. The error condition is reported to the other DXE by sending a FRMR response frame. See 2.4.5.

2.4 Description of AX.25 Procedures

The following describes the procedures used to setup, use, and disconnect a balanced link between two DXE stations.

2.4.1 Address Field Operation

2.4.1.1 Address Information

All transmitted frames shall have address fields conforming to 2.2.13, above. All frames shall have both the destination device and the source device addresses in the address field, with the destination address coming first. This allows many links to share the same RF channel. The destination address is always the address of the station(s) to receive the frame, while the source address contains the address of the device that sent the frame.

The destination address can be a group name or club call sign if the point-to-multipoint operation is allowed. Operation with destination addresses other than actual amateur call signs is a subject for further study.

2.4.1.2 Command/Response Procedure

AX.25 Version 2.0 has implemented the command/response information in the address field. In order to maintain compatibility with previous versions of AX.25, the command/response information is conveyed using two bits.

An upward-compatible AX.25 DXE can determine whether it is communicating with a DXE using an older version of this protocol by testing the command/response bit information located in bit 7 of the SSID octets of both the destination and source address subfields. If both C bits are set to zero, the device is using the older protocol. The newer version of the protocol always has one of these two bits set to one and the other set to zero, depending on whether the frame is a command or a response.

The command/response information is encoded into the address field as shown in Fig. 10.

Frame Type Dest. SSID C-Bit Source SSID C-Bit

Previous versions 0 0
Command (V.2.0) 1 0
Response (V.2.0) 0 1
Previous versions 1 1

Fig. 10 -- Command/Response encoding

Since all frames are considered either commands or responses, a device shall always have one of the bits set to one, and the other bit set to zero.

The use of the command/response information in AX.25 allows S frames to be either commands or responses. This aids maintenance of proper control over the link during the information transfer state.

2.4.2 P/F Bit Procedures

The next response frame returned by the DXE to a SABM or DISC command with the P bit set to 1 will be a UA or DM response with the F bit set to 1.

The next response frame returned to an I frame with the P bit set to 1, received during the information transfer state, will be a RR, RNR, or REJ response with the F bit set to 1.

The next response frame returned to a supervisory command frame with the P bit set to 1, received during the information transfer state, will be a RR, RNR, or REJ response frame with the F bit set to 1.

The next response frame returned to a S or I command frame with the P bit set to 1, received in the disconnected state, will be a DM response frame with the F bit set to 1.

The P bit is used in conjunction with the time-out recovery condition discussed in 2.3.5.4, above.

When not used, the P/F bit is set to zero.

2.4.3 Procedures For Link Set-Up and Disconnection

2.4.3.1 LAPB Link Connection Establishment

When one DXE wishes to connect to another DXE, it will send a SABM command frame to that device and start timer (T1). If the other DXE is there and able to connect, it will respond with a UA response frame, and reset both of its internal state variables (V(S) and V(R)). The reception of the UA response frame at the other end will cause the DXE requesting the connection to cancel the T1 timer and set its internal state variables to 0.

If the other DXE doesn't respond before T1 times out, the device requesting the connection will re-send the SABM frame, and start T1 running again. The DXE should continue to try to establish a connection until it has tried unsuccessfully N2 times. N2 is defined in 2.4.7.2, below.

If, upon reception of a SABM command, the DXE decides that it cannot enter the indicated state, it should send a DM frame.

When receiving a DM response, the DXE sending the SABM should cancel its T1 timer, and not enter the information-transfer state.

The DXE sending a SABM command will ignore and discard any frames except SABM, DISC, UA, and DM frames from the other DXE.

Frames other than UA and DM in response to a received SABM will be sent only after the link is set up and if no outstanding SABM exists.

2.4.3.2 Information-Transfer Phase

After establishing a link connection, the DXE will enter the information-transfer state. In this state, the DXE will accept and transmit I and S frames according to the procedure outlined in 2.4.4, below.

When receiving a SABM command while in the information-transfer state, the DXE will follow the resetting procedure outlined in 2.4.6 below.

2.4.3.3 Link Disconnection

2.4.3.3.1
While in the information-transfer state, either DXE may indicate a request to disconnect the link by transmitting a DISC command frame and starting timer T1 (see 2.4.7).

2.4.3.3.2
A DXE, upon receiving a valid DISC command, shall send a UA response frame and enter the disconnected state. A DXE, upon receiving a UA or DM response to a sent DISC command, shall cancel timer T1, and enter the disconnected state.

2.4.3.3.3
If a UA or DM response is not correctly received before T1 times out, the DISC frame should be sent again and T1 restarted. If this happens N2 times, the DXE should enter the disconnected state.

2.4.3.4 Disconnected State

2.4.3.4.1
A DXE in the disconnected state shall monitor received commands and react upon the reception of a SABM as described in 2.4.3.1 above and will transmit a DM frame in response to a DISC command.

2.4.3.4.2
In the disconnected state, a DXE may initiate a link set-up as outlined in connection establishment above (2.4.3.1). It may also respond to the reception of a SABM and establish a connection, or it may ignore the SABM and send a DM instead.

2.4.3.4.3
Any DXE receiving a command frame other than a SABM or UI frame with the P bit set to one should respond with a DM frame with the F bit set to one. The offending frame should be ignored.

2.4.3.4.4
When the DXE enters the disconnected state after an error condition or if an internal error has resulted in the DXE being in the disconnected state, the DXE should indicate this by sending a DM response rather than a DISC frame and follow the link disconnection procedure outlined in 2.4.3.3.3, above. The DXE may then try to re-establish the link using the link set-up procedure outlined in 2.4.3.1, above.

2.4.3.5 Collision Recovery

2.4.3.5.1 Collisions in a Half-Duplex Environment

Collisions of frames in a half-duplex environment are taken care of by the retry nature of the T1 timer and retransmission count variable. No other special action needs to be taken.

2.4.3.5.2 Collisions of Unnumbered Commands

If sent and received SABM or DISC command frames are the same, both DXEs should send a UA response at the earliest opportunity, and both devices should enter the indicated state.

If sent and received SABM or DISC commands are different, both DXEs should enter the disconnected state and transmit a DM frame at the earliest opportunity.

2.4.3.5.3 Collision of a DM with a SABM or DISC

When an unsolicited DM response frame is sent, a collision between it and a SABM or DISC may occur. In order to prevent this DM from being misinterpreted, all unsolicited DM frames should be transmitted with the F bit set to zero. All SABM and DISC frames should be sent with the P bit set to one. This will prevent any confusion when a DM frame is received.

2.4.3.6 Connectionless Operation

In Amateur Radio, there is an additional type of operation that is not feasible using level 2 connections. This operation is the round table, where several amateurs may be engaged in one conversation. This type of operation cannot be accommodated by AX.25 link-layer connections.

The way round-table activity is implemented is technically outside the AX.25 connection, but still using the AX.25 frame structure.

AX.25 uses a special frame for this operation, called the Unnumbered Information (UI) frame. When this type of operation is used, the destination address should have a code word installed in it to prevent the users of that particular round table from seeing all frames going through the shared RF medium. An example of this is if a group of amateurs are in a round-table discussion about packet radio, they could put PACKET in the destination address, so they would receive frames only from others in the same discussion. An added advantage of the use of AX.25 in this manner is that the source of each frame is in the source address subfield, so software could be written to automatically display who is making what comments.

Since this mode is connectionless, there will be no requests for retransmissions of bad frames. Collisions will also occur, with the potential of losing the frames that collided.

2.4.4 Procedures for Information Transfer

Once a connection has been established, as outlined above, both devices are able to accept I, S, and U frames.

2.4.4.1 Sending I Frames

Whenever a DXE has an I frame to transmit, it will send the I frame with N(S) of the control field equal to its current send state variable V(S). Once the I frame is sent, the send state variable is incremented by one. If timer T1 is not running, it should be started. If timer T1 is running, it should be restarted.

The DXE should not transmit any more I frames if its send state variable equals the last received N(R) from the other side of the link plus seven. If it were to send more I frames, the flow control window would be exceed, and errors could result.

If a DXE is in a busy condition, it may still send I frames as long as the other device is not also busy.

If a DXE is in the frame-rejection mode, it will stop sending I frames.

2.4.4.2 Receiving I Frames

2.4.4.2.1
If a DXE receives a valid I frame (one with a correct FCS and whose send sequence number equals the receiver's receive state variable) and is not in the busy condition, it will accept the received I frame, increment its receive state variable, and act in one of the following manners:

1. If it has an I frame to send, that I frame may be sent with the transmitted N(R) equal to its receive state variable V(R) (thus acknowledging the received frame). Alternately, the device may send a RR frame with N(R) equal to V(R), and then send the I

frame.

2. If there are no outstanding I frames, the receiving device will send a RR frame with N(R) equal to V(R). The receiving DXE may wait a small period of time before sending the RR frame to be sure additional I frames are not being transmitted.

2.4.4.2.2
If the DXE is in a busy condition, it may ignore any received I frames without reporting this condition other than repeating the indication of the busy condition.

If a busy condition exists, the DXE receiving the busy condition indication should poll the sender of the busy indication periodically until the busy condition disappears.

A DXE may poll the busy DXE periodically with RR or RNR frames with the P bit set to one.

The reception of I frames that contain zero-length information fields shall be reported to the next level but no information field will be transferred.

2.4.4.3 Reception of Out of Sequence Frames

When an I frame is received with a correct FCS, but its send sequence number, N(S), does not match the current receiver's receive state variable, the frame should be discarded. A REJ frame shall be sent with a receive sequence number equal to one higher (modulo 8) than the last correctly received I frame if an uncleared N(S) sequence error condition has not been previously established. The received state variable and poll bit of the discarded frame should be checked and acted upon, if necessary, before discarding the frame.

2.4.4.4 Reception of Incorrect Frames

When a DXE receives a frame with an incorrect FCS, an invalid frame, or a frame with an improper address, that frame shall be discarded.

2.4.4.5 Receiving Acknowledgement

Whenever an I or S frame is correctly received, even in a busy condition, the N(R) of the received frame should be checked to see if it includes an acknowledgement of outstanding sent I frames. The T1 timer should be cancelled if the received frame actually acknowledges previously unacknowledged frames. If the T1 timer is cancelled and there are still some frames that have been sent that are not acknowledged, T1 should be started again. If the T1 timer runs out before an acknowledgement is received, the device should proceed to the retransmission procedure in 2.4.4.9.

2.4.4.6 Receiving Reject

Upon receiving a REJ frame, the transmitting DXE will set its send state variable to the same value as the REJ frame's received sequence number in the control field. The DXE will then retransmit any I frame(s) outstanding at the next available opportunity conforming to the following:

1. If the DXE is not transmitting at the time, and the channel is open, the device may commence to retransmit the I frame(s) immediately.

2. If the DXE is operating on a full-duplex channel transmitting a UI or S frame when it receives a REJ frame, it may finish sending the UI or S frame and then retransmit the I frame(s).

3. If the DXE is operating in a full-duplex channel transmitting another I frame when it receives a REJ frame, it may abort the I frame it was sending and start retransmission of the requested I frames immediately.

4. The DXE may send just the one I frame outstanding, or it may send more than the one indicated if more I frames followed the first one not acknowledged, provided the total to be sent does not exceed the flow-control window (7 frames).

If the DXE receives a REJ frame with the poll bit set, it should respond with either a RR or RNR frame with the final bit set before retransmitting the outstanding I frame(s).

2.4.4.7 Receiving a RNR Frame

Whenever a DXE receives a RNR frame, it shall stop transmission of I frames until the busy condition has been cleared. If timer T1 runs out after the RNR was received, the waiting acknowledgement procedure listed in 2.4.4.9, below, should be performed. The poll bit may be used in conjunction with S frames to test for a change in the condition of the busied-out DXE.

2.4.4.8 Sending a Busy Indication

Whenever a DXE enters a busy condition, it will indicate this by sending a RNR response at the next opportunity. While the DXE is in the busy condition, it may receive and process S frames, and if a received S frame has the P bit set to one, the DXE should send a RNR frame with the F bit set to one at the next possible opportunity. To clear the busy condition, the DXE should send either a RR or REJ frame with the received sequence number equal to the current receive state variable, depending on whether the last received I frame was properly received or not.

2.4.4.9 Waiting Acknowledgement

If timer T1 runs out waiting the acknowledgement from the other DXE for an I frame transmitted, the DXE will restart timer T1 and transmit an appropriate supervisory command frame (RR or RNR) with the P bit set. If the DXE receives correctly a supervisory response frame with the F bit set and with an N(R) within the range from the last N(R) received to the last N(S) sent plus one, the DXE will restart timer T1 and will set its send state variable V(S) to the received N(R). It may then resume with I frame transmission or retransmission, as appropriate. If, on the other hand, the DXE receives correctly a supervisory response frame with the F bit not set, or an I frame or supervisory command frame, and with an N(R) within the range from the last N(R) received to the last N(S) sent plus one, the DXE will not restart timer T1, but will use the received N(R) as an indication of acknowledgement of transmitted I frames up to and including I frame numbered N(R)-1.

If timer T1 runs out before a supervisory response frame with the F bit set is received, the DXE will retransmit an appropriate supervisory command frame (RR or RNR) with the P bit set. After N2 attempts to get a supervisory response frame with the F bit set from the other DXE, the DXE will initiate a link resetting procedure as described in 2.4.6, below.

2.4.5 Frame Rejection Conditions

A DXE shall initiate the frame-reset procedure when a frame is received with the correct FCS and address field during the information-transfer state with one or more of the conditions in 2.3.4.3.3, above.

Under these conditions, the DXE will ask the other DXE to reset the link by transmitting a FRMR response as outlined in 2.4.6.3, below.

After sending the FRMR frame, the sending DXE will enter the frame reject condition. This condition is cleared when the DXE that sent the FRMR frame receives a SABM or DISC command, or a DM response frame. Any other command received while the DXE is in the frame reject state will cause another FRMR to be sent out with the same information field as originally sent.

In the frame rejection condition, additional I frames will not be transmitted, and received I frames and S frames will be discarded by the DXE.

The DXE that sent the FRMR frame shall start the T1 timer when the FRMR is sent. If no SABM or DISC frame is received before the timer runs out, the FRMR frame shall be retransmitted, and the T1 timer restarted as described in the waiting acknowledgement section (2.4.4.9) above. If the FRMR is sent N2 times without success, the link shall be reset.

2.4.6 Resetting Procedure

2.4.6.1
The resetting procedure is used to initialize both directions of data flow after a nonrecoverable error has occurred. This resetting procedure is used in the information-transfer state of an AX.25 link only.

2.4.6.2
A DXE shall initiate a reset procedure whenever it receives an unexpected UA response frame or an unsolicited response frame with the F bit set to one. A DXE may also initiate the reset procedure upon receipt of a FRMR frame. Alternatively, the DXE may respond to a FRMR by terminating the connection with a DISC frame.

2.4.6.3
A DXE shall reset the link by sending a SABM frame and starting timer T1. Upon receiving a SABM frame from the DXE previously connected to, the receiver of a SABM frame should send a UA frame back at the earliest opportunity, set its send and receive state variables, V(S) and V(R), to zero and stop T1 unless it has sent a SABM or DISC itself. If the UA is correctly received by the initial DXE, it resets its send and receive state variables, V(S) and V(R), and stops timer T1. Any busy condition that previously existed will also be cleared.

If a DM response is received, the DXE will enter the disconnected state and stop timer T1. If timer T1 runs out before a UA or DM response frame is received, the SABM will be retransmitted and timer T1 restarted. If timer T1 runs out N2 times, the DXE will enter the disconnected state, and any previously existing link conditions will be cleared.

Other commands or responses received by the DXE before completion of the reset procedure will be discarded.

2.4.6.4
One DXE may request that the other DXE reset the link by sending a DM response frame. After the DM frame is sent, the sending DXE will then enter the disconnected state.

2.4.7 List of System Defined Parameters

2.4.7.1 Timers

To maintain the integrity of the AX.25 level 2 connection, use of these timers is recommended.

2.4.7.1.1 Acknowledgement Timer T1

The first timer, T1, is used to make sure a DXE doesn't wait forever for a response to a frame it sends. This timer cannot be expressed in absolute time, since the time required to send frames varies greatly with the signaling rate used at level 1. T1 should take at least twice the amount of time it would

take to send maximum length frame to the other DXE, and get the proper response frame back from the other DXE. This would allow time for the other DXE to do some processing before responding.

If level 2 repeaters are to be used, the value of T1 should be adjusted according to the number of repeaters the frame is being transferred through.

2.4.7.1.2 Response Delay Timer T2

The second timer, T2, may be implemented by the DXE to specify a maximum amount of delay to be introduced between the time an I frame is received, and the time the resulting response frame is sent. This delay may be introduced to allow a receiving DXE to wait a short period of time to determine if there is more than one frame being sent to it. If more frames are received, the DXE can acknowledge them at once (up to seven), rather than acknowledge each individual frame. The use of timer T2 is not mandatory, but is recommended to improve channel efficiency. Note that, on full-duplex channels, acknowledgements should not be delayed beyond k/2 frames to achieve maximum throughput. The k parameter is defined in 2.4.7.4, below.

2.4.7.1.3 Inactive Link Timer T3

The third timer, T3, is used whenever T1 isn't running to maintain link integrity. It is recommended that whenever there are no outstanding unacknowledged I frames or P-bit frames (during the information-transfer state), a RR or RNR frame with the P bit set to one be sent every T3 time units to query the status of the other DXE. The period of T3 is locally defined, and depends greatly on level 1 operation. T3 should be greater than T1, and may be very large on channels of high integrity.

2.4.7.2 Maximum Number of Retries (N2)

The maximum number of retries is used in conjunction with the T1 timer.

2.4.7.3 Maximum Number of Octets in an I Field (N1)

The maximum number of octets allowed in the I field will be 256. There shall also be an integral number of octets.

2.4.7.4 Maximum Number of I Frames Outstanding (k)

The maximum number of outstanding I frames at a time is seven.

I don't know of any Internet references. My Pocket PCRef book says that the SHD3062A is a 121 Meg IDE Drive. It has 4 heads, 1479 cyls, 40 Sec/track. No other parameters are listed for the drive.

233. TPK and Unix?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-14 03:51:08 UTC
From: dave@eram.esi.com.au
Message-ID: <3f7hnc$7ij@eram.esi.com.au>
Source record: 45365

I asked this question on the local packet network, and got offers of
the TPK binary, which wasn't what I wanted, so perhaps the average IQ
here is somewhat higher...

I am looking at implementing TPK on my BSD/386 box, so as to keep an
eye on the local BBS (yes, I know it's a step backwards, but I have my
reasons for doing so) and I do _not_ want to run Messy-Dog for that
sole purpose.

Does anyone have, in no particular order:

the TPK protocol spec, the TPK source, a Unix version of TPK.

Or perhaps I coukd have a stab at running it under the Messy-Dog
emulator instead...

235. Digital Communications on VHF/UHF frequencies

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-15 17:24:36 UTC
From: tao@maroon.tc.umn.EDU
Message-ID: <2f195a8437b4002@maroon.tc.umn.edu>
Source record: 45367

I have been following with interest the exchanges between Nels Harvey of WAR and others. The "noise" he mentions is of course a perfectly legal, fm transmission that has frequency components not part of regular speech. As a general practise, FM voice operations using currently available amateur equipment has several weaknesses. Voice signals almost always have a deviation in excess of 3 KHz. Properly adjusted 9k6 packet signals have a deviation between 2.5 and 3.0 KHz to assure that the signal stays within 15 KHz. To make matters worse, the front ends of our receivers have been "opened up" to assure that they are capable of receiving 162 MHz weather and in some cases 118 MHz aviation or 800 MHz cellular. When we combine this with gain antennas and the substantial power levels of mobile and base stations, we must anticipate that "interference" to voice repeaters is a normal part of amateur operations. A brief drive through the metro areas of any state provide us a chance to personally observe cross-modulation.

I suspect this means that we amateurs are moving toward a situation where we are like the neighbors that object to HF operations that interfere with their TV set. Very often it is the design of the set that makes it difficult to get good reception. As amateurs we are expected to understand that there will be signals on frequencies close to ours and we should take appropriate technical steps to reject signals which are interfering with our use of a frequency. On HF, there are often complaints about Contest Operation or DX pileups. Unless the published scores are bogus (I am sure they are not), it is apparent that a substantial number of people are able to operate effectively in a crowded portion of the band.

But, it is by no means appropriate to compare FM voice repeater operation with HF contest operation. My only reason for comparing the two is to point out that coping with "interference" of various types comes with the territory. The FM repeater coordinating groups have performed a great service to VHF/UHF amateur operations by establishing a structure which minimizes inadvertent interference between repeater systems. Having been licensed for more than 40 years, I do recall the great "repeater wars" from days gone by. (Definitely NOT the good old days).

It is my observation that in some geographic areas, repeater operators (and perhaps repeater coordinators) have not "pushed" technology into repeater systems. Specifically, the use of tone acccess (coded and/or single tone) control by repeaters used to achieve improved signal rejection. The argument often is made that the users don't want to change equipment; I suspect it is the repeater operators more than the users who do not wish to change equipment. Most of us (according to our XYL's) are always buying something new.

The utilization level of repeater frequencies varies from one region to another across the US. Except for a few repeaters in the most densely

popluated parts of the US, the duty cycle of any particular repeater frequency is usually less than 50% over a 24 hour period. I wonder if we would not be better served by looking at how we can put MORE communications in any portion of the VHF/UHF bands rather than accepting that we will restrict operations to allow a few stations to have a "clear channel". If the power level of packet repeaters/nodes were adjusted appropriately and tone controlled access existed for voice repeaters, I wonder if it would be possible to run a high speed packet repeater within 25 miles of a voice repeater on the same frequency.

Further, if one scans the simplex frequencies (at least in my local area), it is very rare to find people using them. On the other hand, people often comment that they can copy the station they are in contact with on the repeater input. Good operating practice would suggest that repeaters be used for establishing contact and prolonged conversations be moved quickly to simplex channels when feasible. In my local area such connect and move is the exception rather than the rule.

It is a personal speculation that the coordination practices in all but the most densely populated areas of the US, may be archaic. The objective seems to be to promulgate and protect a form of repeater operation similar to that which has been standard for the past ten or more years. But times change and amateur operation should and does evolve. In 1955 I operated SSB on 75 meters. The AM stations insisted that we confine our operation to 3990-4000 KHz. Ten years later, SSB had become the predominant mode on 75 meters and the AM stations congregated in a small area.

By no means do I suggest that FM voice repeater operations be artificially restricted. On the other hand, I think some additional systems analysis with an eye toward increasing the amount of communication we can achieve within a particular segment of any band wouldn't hurt. I was under the impression that we established repeaters to allow mobile stations with low power and inefficient antennas to communicate. Somewhere along the line, the reuirement to accomodate handhelds seems to have crept in. That seems reasonable since they certainly have inefficient antennas and low power compared to the other stations on the repeaters. The requirement that all repeater service areas be VAST or even LARGE makes less sense. One or two VAST repeaters and a couple of LARGE ones might be quite sufficient. It often seems that individual repeater systems are striving to increase their "service area" by improving antennas and increasing power; sometimes without the benefit of review by coordinators. This may be akin to the "ego" need that causes HF super stations to be created, they certainly are not created simply to establish communications with the folks across the state or country.

At the heart of this long disertation is the thought that Spectrum Management rather than Repeater Coordination is where we should be taking ourselves. In all probability this means that the repeater coordinating groups will need to be a subset of broader considerations. It means that the interests of weak signal users, satellite operators, simplex users and digital communications operators must be added (and perceived to have been added) to the mix. In the process of doing this we need to be very careful

not to damage the excellent structure that has already been established for balancing the interests between potentially conflicting repeater systems. While things may change as we adapt to current conditions and technology, the existing coordination processes represent our best starting point.

For those who have read to this point, I thank you for your attention and would welcome your suggestions on how my ideas on this matter could be improved.

236. IP tunnels connecting AX.25 networks

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-16 09:01:05 UTC
From: dave@hh.sbay.org
Message-ID: <3fdckh$cgc@hip-hop.hh.sbay.org>
Source record: 45368
Cross-posted to: rec.radio.amateur.digital.misc,sbay.hams

I'm interested in finding out more about IP tunnels
and AX.25 networks. At least around here (The San Francisco
Bay Area) there is a fair amount of packet activity.

Has anyone previously worked out any of the logistics
of interconnecting AX.25 networks via the Internet?
There are some AX.25-IP and IP-IP tunneling utilities
now available for Linux.

Seems there would have to be some coordination required,
but hey, that can be worked out.

Anyway, I'd like to hear about any experiences,
interest and ideas on the part of the amateur community
for projects like this.

73,
Dave KE6AJC

... If the compile of nos you're using has that feature in it...

The correct form of the command (as of jnos 110h) is:

attach kiss <asy_interface_label> <port> <label> [mtu]

Hope that helps! 73, Bob, KD7NM

I have posted this in the ML before and no one got back to me or I missed the answer.

I have been away from Ham Radio for over 2 years (stationed in Japan). Now I am hearing this mode called PACTOR. What is PACTOR?

A cross between Packet Radio and AMTOR? That is my best guess.

I am curious since I love packet radio and it seems that everybody talking about high-speed packet too! I see that I'm far behind the times and I have the MFJ-1278 with the first version of their firmware!

Hello dr reader!

My second try with more exact information:

I've got two eproms in my tnc (homemade)

1) For Host-Mode (using SP):
The Firmware 2.1d by NORD><LINK

2) for terminal (using with telix etc)

TNC-2C AX.25 Layer2 Version 2.0
Ausgabe 1.1.4.1 v. 1.9.87

These a the start-up print-outs.
I know that it workes, but i forgott, how.
Maybee you need a spezial NOS-Version.

I tried it already with telix (cmd: KISS ON) The answer was
command unknown. So may be it works also in HOST -Mode.
If you know a solution, please tell me

with kind regards and 73

Dietmar

It isn't distributed as a patch. It is a copressed, tar archive. It unpacks onto /usr/src/linux/net/inet (for the kernel patches) and where ever you want for the applications. You will probably have to edit the Makefile in ../net/inet since it normally has all of the AX25 objects commented out. Then you must add a line to the config.in file to allow you to configure it in to the kernel.

Read the HAM-HOWTO on sunsite.unc.edu. Or send me mail and I will mail it to you.

I was never very happy with the 012 patches and Linux 1.0.9 and have recently upgraded to 1.1.59 and 026 kernel patches with the 022 applications. Both are much better. The new user apps 'listen' and 'mheard' make the upgrade worthwhile by themselves.

Hi There...

I'm new to the group so I apologize if this has already been done to death.

I've been a HAM for about five years, though I've been limiting myself
to 2m (can't run HF in my building... bad grounds... and it's explicit in
the lease...).

I travel a lot and am interested into starting packet. I've just seen
a nice little BayCom TNC the size of a DB25 shell. Sorry, I don't know
the model... It would be great on the road with my laptop and Kenwood
TH-225A. I'm not really interested in mailboxes or the like, just a
straight TNC. Maybe I'll eventually want more, but not now...

Anyone have anything to say about the thing? Both good or bad accepted.

E-mail or post, thanks...

245. FT-736R SAT. Mod Help Please

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-17 07:26:18 UTC
From: root@distrib.jriver.com
Message-ID: <3ffreq$6aq@distrib.jriver.COM>
Source record: 45377

Thanks to the help from this group, I have the ft736 working correctly
with terrestrial 9600 baud packet on 70cm. Thanks especially to the
person who wrote a great letter with several suggestions, you were
right, the TX problem was impedence related.

I have a couple more questions.

1) This radio is going to be mainly used for communicating with satellites,
what is a good place to get the SSB output for use with the PSK modem?
I'd prefer NOT to use the speaker or headphone outputs. It would be
nice if there was a fixed signal output somewhere unaffected by the
radio volume control.

2) Any ideas why I can now do 9600 baud no problem on 70cm with the
modulator/discriminator mod BUT when I switch the radio to a freq
on 2m where I know there is a bunch of 9600 baud packet going on, and
I can observe strong signals, my TNC
sees nothing. Are the mod/disc I/O points valid for 2m also?

Thanks & 73

Bob

> 3-link, I've got the radio (TH-28), I'm looking at TNC's, what I am
> lacking is the software. Anybody got any ideas?
>

There are several solutions:
1)Use the 3-Link terminal program
2)find a packet program
3)write your own in OPL

I was using solution 2 while my Amiga's serial port was out, but I reckon, that it's not very friendly! (comparing it to my Amiga of course!!!)

If anybody, has got a packet program, I would be VERY interested!

Hello es tnx reading this,
sorry may be it is the wrong list, but I am just experimenting transmitting
voice on hamradio by reading a normal text.file. I have got a 16bit
soundcard, but it is not so original soundblaster one. It is a compatible
one, but I have only the driver for the socalled advanced soundchip, so I
can not use it for reading text. I think I need an elderly version of the
sbtalker.exe (and may be ctts.drv and blaster.drv too). I would be pleased
if there is someone who has got a hint if and where I can find the drivers.

tnx in advance es vy 73 de Wolfgang (DL7VWH)

248. Packet radio in a multi node environment

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-17 08:33:36 UTC
From: ron@ice.NL
Message-ID: <MAILQUEUE-101.950117093335.352@hera.ice.nl>
Source record: 45380

I am interested in packet radio as a solution for a kind of
telemetrie system. The goal is to have two way communivcation between
testing nodes and one or more central computers.

This is the situation:

- Having between 500 and 1000 test nodes in a region of about a few
square kilometres. Each node must be able to send and receive
data (strings) with addressable information. A polling mechanism can
be used.

- The central computer should be able to multicast to all nodes or a
group of nodes in once.

- Data transport should be transparent and will be delivered by the
test application to a serial port.

- Maximum datarate will 9600 bps.

These are my questions:

Can packet radio be used in this situation?

What about reliability, performance, security?

Who knows about the same kind of projects?

Tnx in advance

Source record: 45381

Hello,

I'd like to improve my local packet radio network using 10 GHz links for "on-sight" locations. I've recently received information about Advanced Receiver Research's gunnplexer transceiver. It looks great for voice links (between two repeaters for example), but has someone ever tried to use it for HIGH-SPEED data transmissions (38k4 or above I mean) ?

Specifications indicate a 280 kHz bandwidth at -3 dB, on the 30 MHz Fi receiver. This should be good enough...

Thanks in advance for any information, in this newsgroup, or directly via Email.

>the power level of packet repeaters/nodes were adjusted appropriately and
>tone controlled access existed for voice repeaters, I wonder if it would be
>possible to run a high speed packet repeater within 25 miles of a voice
>repeater on the same frequency.

My understanding of tone control is that it is used to open the repeater's transmitter. After that, what is transmitted is whatever is on the input. This works reasonably well with voice because there is a finite not-too-large probability that two people will want to talk at the same time on a frequency shared by tone-controlled repeaters and the people who share the frequency are separated by enough distance that "capture effect" works to the advantage of the local machine.

Given that packet tends to have a higher probability of transmitting in a given channel, and given that 25 miles is not very far, I wonder if tone control is an answer? Besides, with all the recent talk about DC response required in packet I guess I had gotten the impression that adding a subaudible tone would interfere with operation of high speed packet. (I'm probably misunderstanding, but by mentioning it I know I'll draw a correction....)

>Further, if one scans the simplex frequencies (at least in my local area),
>it is very rare to find people using them. On the other hand, people often
>comment that they can copy the station they are in contact with on the
>repeater input. Good operating practice would suggest that repeaters be
>used for establishing contact and prolonged conversations be moved quickly
>to simplex channels when feasible. In my local area such connect and move
>is the exception rather than the rule.

Many repeater discussions are intended to be "roundtable." On my favorite machine people delight in noting they can hear eachother on the input, but since the diverse stations in the roundtable are widely separated everyone stays put.

>It is a personal speculation that the coordination practices in all but the
>most densely populated areas of the US, may be archaic. The objective seems
>to be to promulgate and protect a form of repeater operation similar to
>that which has been standard for the past ten or more years.

I believe you're right, though I would guess it's unintentional. Your excellent idea to focus on spectrum management rather than repeater

coordination seems like the kind of thing that would take hold if you championed it.

>The requirement that all repeater service areas be VAST or even LARGE makes
>less sense. One or two VAST repeaters and a couple of LARGE ones might be
>quite sufficient.

I once worked with a hardware engineer who "proved" that a 3 page per minute laser printer was all anyone needed because that means they print 4320 pages a day -- who would need more?

While I agree a coordination body might want to ensure they get at least a certain amount of coverage, it's important to design redundancy. In an emergency you don't know where the local power outage is going to strike. Even if you just need to find an alternate repeater because the VAST one you favor is busy that's enough value, I think.

Utility aside, you also have to realize these machines are at the bottom something privately owned. A coordination body that tried to micro-manage to the point of dictation coverage area wouldn't be able to maintain cooperation.

At the heart of this long disertation is the thought that Spectrum Management rather than Repeater Coordination is where we should be taking ourselves.

As I said, I like the idea a lot. It might have helped prevent clashes between the packet cluster community (for example) and space operations, for example. But given the amount of heat that repeater coordinators get, I don't imagine it would be an easy thing to pull off. But I'm with you, win or draw..... ;-)

The Tigertronics BayPac is the modem I think you are referring to and I had one. It is a nice, simple, useful little gadget. However, I said I *had* one. I owned a Zenith laptop computer at the time I got it and it worked great from the parallel port of this computer. About a week after I got the BayPac, I got a new notebook computer for my work and had to send the Zenith back to the lease people. I found that the low power consumption features in the notebook were not sufficient to drive the BayPac. In the manual it showed that the modem required something like 10v and I was only getting 8.5 to 9v from the port. It wouldn't run at all. As I said, on the other laptop, or on a friend's desktop, it ran perfectly. I called Tigertronics and they couldn't help me. I had some local HAMs look at it but to no avail. I ended up selling it and, to my knowledge, it is still in operation here in the area. To make a long story longer, the moral of the tale is "Check the voltage from your parallel port!" and make sure it's 10v or more. I wanted it for portable use myself. It would be a great setup.

260. TM-742A mod correction

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-17 14:50:30 UTC
From: paidukas@huey.mis.semi.harris.com
Message-ID: <3fglfm$i14@hearye.mlb.semi.harris.com>
Source record: 45387

I received the TM742 mod from the Oakland FTP site and noticed that the information contained was incomplete. The file `tm742.mod' only stated that one chip resistor be moved. Actually three chip resistors must be moved for the mod to be complete. The following information has been ammended and is now complete. This mod also enables 100 extra memories per band. See other documentation on Oakland FTP site for details.

ASI-0002, Feb. 23, 1993 (Ammended)

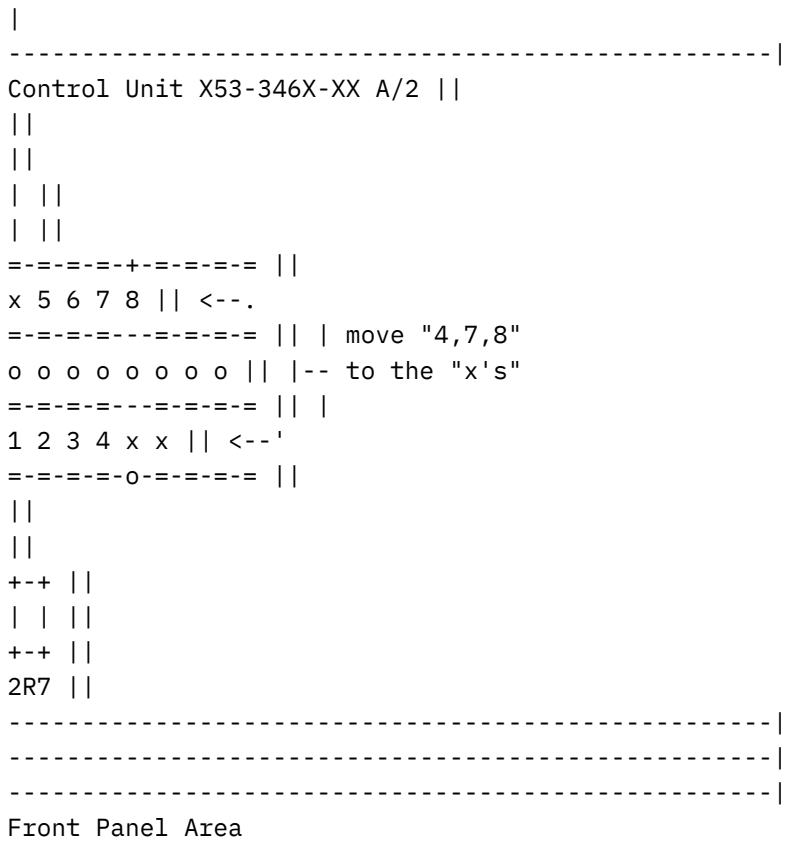
This is a summary of the modification provided by Kenwood to expand the transmit/receive ranges for the TM-742/942 tri-band radio. The sheet is ASI-0002, subject "TM-742/942 Beyond Mars/CAP Mod. Guide" and date "February 23, 1993". The actual ranges of what the radio will transmit are wider than what is stated in the table below.

Note: this mod involves desoldering and resoldering chip resistors, if you are not an expert in soldering chip components, get an expert to do this for you.

1. Remove the front panel.
2. Remove the bottom cover from the radio.
3. Looking at the exposed bottom of the radio, orient it so it matches the diagram below.
4. Move the chip resistors as shown in the diagram. The numbers "1" thru "8" represent the positions of the 8 chip resistors in the original positions from the factory for U.S. radios. The "x" is an empty pair of pads where the numbers "4,7,8" resistors should move to.
5. Reassemble the radio and reset the microprocessor (see manual).
6. Frequency ranges will be:

28 Mhz band: RX: 18.0 - 54.0
TX: 26.0 - 45.0
50 Mhz band: RX: 40.0 - 90.0
TX: 46.0 - 76.0
144 Mhz band: TX: 136.0 - 174.0
220 Mhz band: RX: 215.0 - 260.0
TX: 215.0 - 235.0
440 Mhz band: TX: 420.0 - 450.0
1.2 Ghz band: RX/TX: 1100 - 1400

Notes: not all radios will be able to tune the entire range.



END

It would seem that ham radio can use T1 or better speed links for
the digital relaying of repeater audio for the linking of multiple repeaters
and all kinds of other good things. T1 is about 1.5Mb/s give or take some
speed depending upon data frame format. ISDN or Integrated Services Data
Network is a 64Kb/s standard for digital voice telephony. One can fit 24
ISDN channels in to a T1 or some mix of voice and data and a smaller number of
audio channels depending upon what is needed.

One of the oldest new things out there is something called ATM which
stands for asynchronous transfer mode. It was first born in the sixties,
but is now gaining favor because the technology is now catching up with
what is theoretically possible. ATM handles everything from voice to data
and has room in its protocol for something called quality of service which
indicates whether the data being handled are time sensitive such as voice or
video or whether the data can be slipped in where possible such as X.25
packets or TCP/IP.
Knowing little more than I have just said, it seems that we hams
could use ATM to provide point-to-point conduits for packet and repeater
audio over a bandwidth about the same as a television channel. ATM is usually
used at very high speed links such as 44.7Mb/s or higher, but it is not
limited to any one speed. It is a protocol for handling data which will run
as fast or as slowly as the channel on which it is sent.

Ed, JNOS does support RSPF. It may not be compiled into the versions that
you have. To see, at the command line enter "info". All the compiled in
options will be listed. To compile it in, you will need Borland C++ 3.1.
Unfortantely, the source code is compiler specific.

You may be able to find a ftp site that has a JNOS exe with RSPF

Try anonymous ftp to pc.usl.edu. It runs in a similar fashion to the TCP protocols here on the Internet so you will have to contact your local IP address administrator for the AMPRnet. It'll run your Baycom modem with a driver, though I am not familiar with that operation, and it is great for networking. It tends to be a bit involved for someone who only wants to read the mail from a BBS but is quite nice to hook up for file transfers, mail forwarding and such. There are also a whole bunch of different versions of it for different applications and different computers. Keep checking in here and in the digital newsgroup for info.

I used to use a version called NOSView 3.04 and I believe it had RSPF as
a part of its compilation. I think you may be able to find it at the
anonymous ftp site ftp.ucsd.edu in the tcpip subdirectory of packet in
the hamradio subdirectory. /hamradio/packet/tcpip. It is also on the Oct
1993 version of the Buckmaster HamCall CD ROM.

->
-> --

Try the book, "WHAT IS YOUR TNC DOING?" It is a GREAT
beginner/intermediate handbook that walks you through the basics.

Or download the 20 part WB9LOZ series...Each are FANTASTIC intro's to
packet.

don't waste your money on the books written by the PHD's, unless of
course you're one yourself and can understand what they are saying.

Regards..

Alex,
Pactor is a digital mode developed for HF which builds on the ideas found in packet and amtor. In addition to being error free, it can piece together a good frame from several damaged ones, often reducing the number of resends necessary. It changes baud rate to match conditions, and can run at 100 or 200 baud. Like AMTOR, it includes an FEC mode for CQing or what have you. And all the multimodes now offer it - it's presently the most popular digital mode on HF. (Oops - next to CW.)

See you on Pactor!

From what I've hard here, you can't use that for high speed use, hence
the reason the modulator/discriminator mod.
If this is OK for SSB in SAT use, that would be great.

: >2) Any ideas why I can now do 9600 baud no problem on 70cm with the

PRESS RELEASE

JANUARY 17, 1995

WVARA ANNOUNCES WEB PAGE

The West Valley Amateur Radio Association (WVARA) is announcing the development of it's own home page. WVARA joins the ranks of many other amateur radio clubs in having a home page with links to other points of interest to other hams. This includes links to other clubs, the FCC gopher server, all of the amateur radio related UseNet groups and other Web points of interest to hams.

The WVARA home page is run in conjunction with a law-oriented home page, providing links to most legal-related web points of interest.

The WVARA home page can be visited at:
http://www.portal.com/~twise/

For more information, e-mail twise@sparta.sjsu.edu

Hello folks. I built the Baycom Modem and I can run it on any laptop without
any problem. It's different from BayPac. This Baycom modem is using the
famous TCM3105 chip. It can be used to run the Baycom and TPK softwares.

I can send you the circuit diagram (GIF file in UUENCODED format) if you're
interested to build...it's very simple and very cheap to build.

The RTTY and FAX programs Jvfax and Hamcomm use a software comparator.

I want to experience a bit with short wave signals and need therefore a source of such a software comparator.

Although the writers of JVfax and Hamcomm stated well how to write a software comparator, I miss some details like turning the right interrupt lines on and programming the timer interrupt. I just don't have the time to find out about the details by myself so here comes my question:

WHO CAN HELP ME.

You can mail responses to leeuw@cs.utwente.nl.

Thank's.

Having worked on ATM back at Bellcore, I can say that I wouldn't want to use it in ham radio even if somebody gave us working equipment for free. Like ISDN, ATM is full of compromises, hacks, gratuitous complexity and other serious problems from its telco origins. There's no particular reason to use it to carry IP traffic or the like if you have a choice.

I'll probably go ISDN soon from home. Not because I like it, but because of a) my telco's decision to sell it much more cheaply than the point-to-point leased line to work that I'll turn it into, b) their refusal to build the simple connectionless packet network that I really want, and c) a lack of competitive alternatives, given that your average cable company is even more clueless about data than your average telco.

Phil

283. Direct Digital Synthesizes

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-19 10:12:39 UTC
From: gebruiker@vnet3.vub.ac.be
Message-ID: <3fldun$b1a@rc1.vub.ac.be>

I'm looking for scematics, data sheets, etc of Direct digital syntesezers
to desing a local oscilator in a high performance comminication receiver
I've got a few data sheets and aplication notes of Analog Devices.
Every information is welkom. Because it's dificult to find something
on that subject.

If you're interested let me now, i'll send you the information i have.

Thanks, STIJN

No, they are still in business. They just stopped wasting their time with
amateur radio operators.

285. Linux AX.25 Software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-19 16:37:52 UTC
From: jrr@nwu.edu
Message-ID: <3fmpgp$hb8@news.acns.nwu.edu>
Source record: 45262

We are currently in the process of setting up a packet station at our local radio club, but don't know where to find good packet software. Here is what would be good:

-Multiple users telnetting in to use the TNC at one time (not necessary)

-Control of who is allowed to use the station

-Automatic connection to certain stations

-Choice of inputting own call or using club's call.

Does anyone know of any software that is capable of this? The software called TNT that is designed for linux is exactly what we are looking for, but uses the W8DED protocol. Is it possible to use software to emulate this protocol? Does anyone know where I can get information
on it?

Thanks,
John Rosenbaum

I am a new Ham newbie & need some help on packet equipment. I have
just purchased a HT for 2m & 70cm. I want to get into tcpip packet, but also want
something that is good for rtty, amtor, packet, tcpip, etc.

I have picked up a Kennwork 530S HF rig and would like something that
could do HF as well.

What should I be looking for? any recommendations?

Thanks, Tom.

I'm no expert, nor do I play one on tv, but I'd suggest that you use
whatever is being used in your area as that will insure you have some
local help!

In New England, JNOS 110h with the NEDA modifications is very popular and
seems to be very stable. Runs under dos.

292. Patch on SERV.EXE - FBB ver.5.15c

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-20 13:18:41 UTC
From: i5sgg@ir5fit.ARcetri.astro.IT
Message-ID: <518.i5sgg@ir5FIT.arcetri.astro.it>
Source record: 45272

***** Change Msg header from FBB to W0RLI format *****

Whit program like PC Tools or Disk Editor by Norton you must
change the data like follow, remember this is valid ONLY
for English version:

OLD NEW Address
Z 5A z 7A 2d17c
@ 40 % 25 2d17e
: 3A % 25 2d17f
% 25 N 4E 2d180
% 25 @ 40 2d181
R 52 % 25 2d182
<space> 20 % 25 2d183
23 R 52 2d184
: 3A % 25 2d185
% 25 s 73 2d186
% 25 <NUL> 00 2d187
N 4E <NUL> 00 2d188
% 25 <NUL> 00 2d189
s 73 <NUL> 00 2d18a

On INIT.SRV file, directory \FBB, you must remove the header line
but leave only a return like follow:

```
##############################################################################################################
# New in 5.15b:
# R:line has been changed in the software.
#[$c] $$:$R

##############################################################################################################
```

The result is :

Old header:

R:941031/0615Z @:I5SGG.ITA.EURO #:63849

New header (4 byte less from previous format):

R:941031/1220z 63977@I5SGG.ITA.EURO

With this change you can help the packet network, because
you reduce your overlay for single Msg (up to -50% less).

I hope that all MailBox software authores will use this header
in the future version.

Remeber also to reduce, as you can, your Hierarchical address.

Many thanks for your cooperation !

... Mark

Subject: ?tnc and Kiss-mode / second

Hello dr reader!

My second try with more exact information:

I've got two eproms in my tnc (homemade)

1) For Host-Mode (using SP):
The Firmware 2.1d by NORD><LINK

2) for terminal (using with telix etc)

TNC-2C AX.25 Layer2 Version 2.0
Ausgabe 1.1.4.1 v. 1.9.87

These a the start-up print-outs.
I know that it workes, but i forgott, how.
Maybee you need a spezial NOS-Version.

I tried it already with telix (cmd: KISS ON) The answer was command unknown. So may be it works also in HOST -Mode.
If you know a solution, please tell me

with kind regards and 73

>I understand there is an AX25 driver that is winsock compatible.

The one I know of is called ETHRAX25.ZIP, and it's a Packet Driver that talks to a KISS TNC, but which pretends to the Winsock stack (or any other application) that it's an Ethernet driver.

I can't remember where it is FTP'able from, I'm afraid.

From: root@distrib.jriver.com (0000-Admin(0000))
Subject: FT-736R SAT. Mod Help Please

Thanks to the help from this group, I have the ft736 working correctly
with terrestrial 9600 baud packet on 70cm. Thanks especially to the
person who wrote a great letter with several suggestions, you were
right, the TX problem was impedence related.

I have a couple more questions.

1) This radio is going to be mainly used for communicating with satellites,
what is a good place to get the SSB output for use with the PSK modem?
I'd prefer NOT to use the speaker or headphone outputs. It would be
nice if there was a fixed signal output somewhere unaffected by the
radio volume control.

2) Any ideas why I can now do 9600 baud no problem on 70cm with the
modulator/discriminator mod BUT when I switch the radio to a freq
on 2m where I know there is a bunch of 9600 baud packet going on, and
I can observe strong signals, my TNC
sees nothing. Are the mod/disc I/O points valid for 2m also?

Thanks & 73

Hi Ed,

As the person at AEA (when I was there) who wrote that stuff, I'll try
to dredge up how I did it and present it here.

Basicly all there is to is are a couple of text files with the proper
character strings, a pair of batch files that accept COM port number
and baud rate, then use the DOS MODE and COPY commands to configure
then write the file out to the COM port specified. Definitly low-tech.

As I said, I'll try to reconstruct that code - or rewrite it from
scratch - and post it to this newsgroup. It's getting late (or early,
depending on your perspective), and I need to toddle off to bed...

>
> mark ka1oj@aol.com

You have two or three courses of action:

1) Try to convince AEA technical support that you want to buy (and are
willing to pay for) July, 1990 PK-87 firmware. This was not publicly
released, but at one time AEA would provide it for the usual firmware
upgrade price. The current management may not make it available tho.
You'll also have to know if your PK-87 is an early unit or a late unit.
The best way to tell is to look at the crystal on the PC board. If it
is a 2.4576 MHz unit, you have an early PK-87. If its a 4.9152 MHz
unit, then you have a late PK-87.

2) Failing the above, ask the AEA tech rep to send you the service
bulletin to upgrade the PK-87. As I recall, for an early PK-87, this is
service bulletin 48, for the late PK-87, service bulletin 49. The end
result of properly installing the upgrade is that your TNC is converted
to 32k of ram, and if it was an early unit, it now has the 4.9152 MHz
clock. At that point you can get a PK-88 EPROM - whatever the last
version was - and install it in your PK-87 - now fully PK-88 compatible.

3) I vaguely recall that the G8BPQ packet switch software had a PK-87
or PK-88 KISS implementation packaged with it, at least at one time.
Try locating that package on the net (should be at ftp.ucsd.edu) and
look at it. That will get you an EPROM image that anyone who can burn
27256's should be able to get stuffed into one for you.

I'm not aware of any other alternatives, if you can't get that version
to work. I know (as a former AEA customer service tech) that AEA's
firmware containing KISS which was dated prior to June, 1990 had a
bug that would manifest itself as damaged transmit packets in situations
where the channel was busy. Your firmware being older than that will
definitly have the bug. Another issue solved by the later firmware is
the ability to use packets larger than about 280 bytes. I've personally
used it to at least 1024 byte packets.

Hope that helps. 73, Bob

I've got a 3 tnc, CoaxLan going with a Tiny-2 TNC and 2 MFJ 1270b TNCs. The
PacComm Tiny-2 is located on the first floor of a building in a T1 cabinet and the
two MFJ tncs's are located on the second floor in a telco closet. The TNCs are
connected using about 150 feet of coax. Works ok.
I did have a problem when the coax-lan connector touched the heat-sink fins
on my power supply. The heat-sink was +12 volts and most of the surface mount
parts on the coax lan vaporized and it took out all the ICs in the TNC. I'd suggest
wrapping the metal part of the coax-lan adapter in electrical tape. That would
have probably preventend my problem.

From: dave@eram.esi.com.au (Dave Horsfall)
Subject: TPK and Unix?

I asked this question on the local packet network, and got offers of
the TPK binary, which wasn't what I wanted, so perhaps the average IQ
here is somewhat higher...

I am looking at implementing TPK on my BSD/386 box, so as to keep an
eye on the local BBS (yes, I know it's a step backwards, but I have my
reasons for doing so) and I do _not_ want to run Messy-Dog for that
sole purpose.

Does anyone have, in no particular order:

the TPK protocol spec, the TPK source, a Unix version of TPK.

Or perhaps I coukd have a stab at running it under the Messy-Dog
emulator instead...

Having worked on ATM back at Bellcore, I can say that I wouldn't want
to use it in ham radio even if somebody gave us working equipment for
free. Like ISDN, ATM is full of compromises, hacks, gratuitous
complexity and other serious problems from its telco origins. There's
no particular reason to use it to carry IP traffic or the like if you
have a choice.

I'll probably go ISDN soon from home. Not because I like it, but
because of a) my telco's decision to sell it much more cheaply than
the point-to-point leased line to work that I'll turn it into, b)
their refusal to build the simple connectionless packet network that I
really want, and c) a lack of competitive alternatives, given that
your average cable company is even more clueless about data than your
average telco.

>
> One of the things which I have been curious about is how close
>is the TCP/IP used on the Internet to that which is used in amateur radio?

It's identical in the main. Some details of timer values are relaxed, route tables are static and normally cluster routed, and details of ARP interaction with AX25 are slightly different than what you may be used to seeing.

>I have the same question about AX.25 VS X.25.

Not the same. AX25 is *loosely* based on X.25, *very* loosely based on X.25. It has elements grafted on that cover all the way from layer one channel control issues to link level issues to source routing issues to transport layer issues to presentation layer issues. It can also be used in a kludged datagram fashion, that's the way it's normally used with TCP/IP. Stripped to its basics, its X.25 roots can be identified.

>In my work, I deal with
>name servers, somewhat with routers, and the usual bunch of TCP/IP applications
>such as telnet, FTP, etc. I do not own a TNC but hope to get one in the

>question goes for AX.25 and X.25. Has anybody written a book about these
>comparisons? If anybody knows of a good book specifically comparing the
>amateur radio versions of X.25 and TCP/IP with their wired counterparts
>I would like to know its title and other information.

Almost everything you know about TCP/IP will directly translate to the amateur world. The only real differences will deal with ARP issues. Almost nothing you know about X.25 will be of use. It's more likely just to serve as a source of confusion.

The ARRL has released a document containing the AX25L2V2 specification. If you aren't intimidated by state diagrams, it'll answer your AX25 questions. There's a book called _NOSIntro_, also available from the ARRL, that gives you a hands on introduction to the amateur TCP/IP suite's practical implementation details, such as the form of interface attach commands, the ARP mapping of addresses to callsigns, etc.

: > Both can be used portable with a 9volt battery.

: For those of us new to packet what is wrong with these tnc's?

Nothing. The only thing about them is that they are pc TNC emulators, not real TNCs with internal processors so you have to leave your pc on when you want to monitor or use the station. The stand-alone TNCs can do just that, stand alone and monitor traffic or receive mail without the pc. The BayPac is just a modem and all the work is done by the pc. I must admit, I started the same way as the other guy. I built a PMP machine and had a blast with it. Before too long, I had a PK-232 on order. I wanted the multimode ability. I still have the PMP. Anyone who is not sure if they will like packet should maybe go with this type of set up. If you don't like it, you aren't out a lot of money. If you do, you can keep this one or upgrade to a more featured TNC and can pass the BayPAc on to a local who is in the same boat you got out of. The choice is always yours.

: Thanks, Tom.

There are several multimode TNCs on the market and your wallet thickness
is proportional to the one you choose. I have a PK-232 from AEA which is
on par with the KAM Plus from Kantronics. They do about the same modes,
except the KAM has G-TOR, so far a Kantronics specific mode. The AEA has
a signal identification mode. It's OK but only recognizes modes it can
operate, not strange modes outside our bands. The KAM has dual ports, as
does the PK-232 but the KAM can operate them simultaneously. The PK-232
can operate all modes from either port but the KAM has multimode
capabilities on one port only. In the same price range is the MFJ-1278,
which has two non-simultaneous ports, operates most modes but has SSTV as
one of them. I don't know how good it is as it is one that I haven't
really used. I am not very familiar with this TNC but there are a few on
the go.

If you want an adaptable TNC, able to expand to the changing modes, then
one of the AEA PK-900 or DSP line seen to be good. These can operate with
DSP and can be upgraded to just about any mode with an EPROM upgrade.
They are in the wallet thinning price range but offer many features not
found in the above-mention bunch. I haven't used either of these but know
people who have and they swear by them.

Then there's the HAL Clover machine, which also does Pactor, AMTOR and RTTY.
Don't know anything about them except what I've read.

There are quite a few TNCs on the go. Depending upon your intended
application, I'm sure you'll find at least 2 that'll do it for you.

The Tigertronics BayPac is the modem I think you are referring to and I
had one. It is a nice, simple, useful little gadget. However, I said I
had one. I owned a Zenith laptop computer at the time I got it and it
worked great from the parallel port of this computer. About a week after
I got the BayPac, I got a new notebook computer for my work and had to
send the Zenith back to the lease people. I found that the low power
consumption features in the notebook were not sufficient to drive the
BayPac. In the manual it showed that the modem required something like

10v and I was only getting 8.5 to 9v from the port. It wouldn't run at all. As I said, on the other laptop, or on a friend's desktop, it ran perfectly. I called Tigertronics and they couldn't help me. I had some local HAMs look at it but to no avail. I ended up selling it and, to my knowledge, it is still in operation here in the area. To make a long story longer, the moral of the tale is "Check the voltage from your parallel port!" and make sure it's 10v or more. I wanted it for portable use myself. It would be a great setup.

Subject: Conductive Paint

I need to find some metallic conductive spray paint to coat the inside of my computer monitor. The monitor housing is plastic and gives me lots of RFI. I have tried many types of paint ie copper, nickel, zinc and other metallic spray paints but can't find one that actuly has metal in it and is conductive. Has anyone done this, and can they recommend a brand available in the western US.

Packet repeaters normally key on the data carrier detect of the regenerating
modem. They won't key on voice transmissions. However, you have identified
the real problem. It's called the near-far problem. That's where a station
"near" one repeater is trying to use the "far" repeater. It RF captures
both receivers, and hence is a severe interfering source for the near
repeater. That's why 25 miles is not nearly enough separation. Ideally,
coverage overlaps only at the edges of the two systems' coverage areas.
This way, stations heard by both repeater receivers are far-far stations
and don't cause severe interference to most users of either system.

>>Further, if one scans the simplex frequencies (at least in my local area),
>>it is very rare to find people using them. On the other hand, people often

>
>Many repeater discussions are intended to be "roundtable." On my favorite
>machine people delight in noting they can hear eachother on the input, but
>since the diverse stations in the roundtable are widely separated everyone
>stays put.

I'll second this. Everyday on my machine there are dozens of stations, spread
over about 3,000 square miles, all in a common roundtable. Simplex UHF simply
can't satisfy that sort of situation in most terrain. Repeaters tend to
attract user communities by interest more than by geography. My machine is
maintained as the "experimenter's intercom" for the metro area. It attracts
users with experimental interests who want to share ideas with a group of
like minded people, who may be rather widely geographically scattered.
Making it co-channel with another machine at a 25 mile spacing would
destroy most of its utility. It'd have to have a far-far coverage circle

of only 12.5 miles radius, and that would exclude a majority of it's users, including me, I live further from the repeater site than that.

A cooperative "cellular" system with "conference call" abilities would be a more efficient usage of spectrum than the current repeater setups. However, this would require a degree of cooperation among trustees, and a degree of financial commitment among both trustees and users, that is currently unfeasible. It would also leave the resulting system more vulnerable to coverage outages in the event of emergencies due to the nature of the centralized switching required. (The commercial boys have ways of "hardening" the system to avoid much of this problem, but that takes major $$$ that hams are unlikely to spend.)

312. RE : Microwave Transceivers

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-21 10:57:55 UTC
From: ajf4@ukc.ac.uk
Message-ID: <9003@raven.ukc.ac.uk>
Source record: 45286

Hello again all,

Thanks for all your replies re my request for information on Microwave
tellurometer units..

Since I posted the article I have progressed to find that the Klystron
driver devices have been causing the 2.7kHz tone. This has been eliminated
by removing the klystrons and replacing them with Gunn Diode devices.

I have since analysed the receiver unit to find that it seems to be working
by slope detection system (IF 46.5MHz).... The modulated Modem output
is now easily demodulated straight from the discriminator and decoded for
the computer... Now that the 2.7KHz tone has been removed, a perfect
eye is received with an equally as good audio spectrum good enough to
replicate that of the orignal modem audio output.

It seems odd to me that it's slope detection!!! This is an old system!!
However, I don't mind, because it makes it easier for me!! :-)

The next stage for me is to tune the gunn diodes correctly to give an
IF of 46.5MHz.. the tuning is very sensitive!!! Very sensitive indeed!
I have made up biasing modulator circuits for these, so now it's
just time to fiddle with the pots and screws!!!

I only hope that RF output of just under 15mW is enough to cover the
distance that I need to install the link over!!!! :) It's probably
about 5 miles or so... Enough power do you think?
The dish antennas are approx 1 foot in diameter, havent a clue what the gain is!

I intend to install an echo cancellation amplifier, as to remove the
transmitted audio from the rx signal. There will be only 1 gunn diode
in each unit providing both transmitter and local oscillator in each.

Once again, many thanks for your replies!! Much appreciated!!

Bye for now, and 73 de Andrew ajf4@ukc.ac.uk g7mjc@gb7yuh.#34.gbr.eu

>
> What should I be looking for? any recommendations?
>

My recommendation would be to go for the AEA PK232-MBX. It deals with all
the modes you mention. I've never tried TCP-IP packet with it, but there
shouldn't be any problems. Having used a PK-232 and a Kantronics KAM, I
prefer the '232 on RTTY on HF as the filtering seems to be better. Of
course, there again - the KAM and KAMPLUS are the only units that support
G-TOR !

Good luck and have fun !

There have been a couple of construction articles on DDS' in 73
magazine.
The first "The Technowhizzy" uses a Qualcomm Q2220 DDS. (December,92)
The second, "The Julieboard" uses a Harris HSP45102 DDS. (August,93)

These are not inexpensive part...the Q2220 goes for about $40
I wonder if you've priced the Analog Devices part ?

I have one and I find it better on HF than a KAM or MFJ 1278. It is larger than the other two but it works great. The command format is good and it has good HF filtering. The manual is better and you can switch from HOST to KISS to Open Loop quite easily.

Hi All,

Questions, questions.....

I'm looking for info re connecting the G3RUH modem to a Yaesu FT209RH.
Found the howto for the 211, but it's fairly vague in the TX section.

Anyone tried this with the HTX202? Got mine up and running, but
barely, ie performs poorly.

Any special requirements in an amp to be used for 9600 activity?
Looking at a couple of 2w in - 150w out models, as the 30 watts I'm now
running is marginal to my 9600 neighbors on a good day.

Are schematics available for the G3RUH modem or the TNC2 (on the net
via ftp)? Is source code available for the TNC2 eprom?

thanks,
rvz

It's *not* a TNC. The TNC functions are provided by software on the
PC. The Baycom unit is simply a modem. Mine works fine, although I
prefer my "proper" TNC.

324. nos in eprom?

Date: 1995-01-22 14:38:17 UTC
From: jcksnste@ACFcluster.nyu.edu
Message-ID: <3ftqkp$2f2@cmcl2.NYU.EDU>
Source record: 45199

Strange question, I suppose.

I intend to do a bunch of packet from my laptop onto the TCP/IP net using my car as a hop (digipeater or node). I don't want to run a full-blown computer in my car, but would rather hook up a kpc-3 with an NOS eprom under the dash. I suppose I could leave the TNC and rig on without a data terminal connected and use it as a digipeater, but I'd rather be more complete. Something like telnetting to it *only* provides access to the TNC port is what I'm interested in.

In addition, the TNC would remain on at all times, and when it detects a packet with it's address as the destination, the eprom triggers a relay to turn on the rig--don't want to run the rig if I'm not going to use it. Of course, I'd have to have like a crystal controlled receiver sending stuff to the TNC as well for that to work.

Looking forward to hearing...

Steve

There probably is but I hope you're good at micro-surgery HI. I would
imagine that the big rig companies will be/are working on getting HTs 9600
baud ready, as they have done with the mobile rigs. Nice for portable
use.

Not sure what the question is but I think the Kantronics DataEngine is
the only (or one of the only) TNCs that will run JNOS from the EPROM,
similar to the TheNET nodes. I have seen a couple versions around that
run in it.

JNOS is the only EPROM based NOS I know of, and it was designed for a
Kantronics DataEngine only.

Hello out there in x1j land...

A friend in Maine sent me an e-mail note saying that he had been informed that there was software posted on compuserve for x1j node management and asked if I could retrieve it. Since I no longer subscribe to compuserve, I can't be of help. However, does anyone out there know of this software and is there an anonymous ftp site where I may get it? If not, could someone who has compuserve dowload it and post it somewhere or uue it to me? Thanks in advance.

There is JNOS for the Kantronics Data Engine, unfortunately, Johan, who was developing it got married and moved to Japan before it was really done. He declined to release the source code into the public domain, so its been stagent since reprioritized his life. Unfortunately, the current version JNOS4010, which is available for FTP, is buggy and almost no one uses it. I tried it for a while, but now have a dedicated computer for jnos and a Data Engine in KISS mode.

Good Luck and 73's de Dave, kd6pro.

The KPC-3 isn't going to do what you want. It's a proprietary architecture,
and third party firmware isn't available. However, any TAPR TNC2 firmware
compatible TNC, like the MFJ1270 or the PacComm Tiny 2, will accept the
TheNet firmware. The recent releases of TheNet have included TCP/IP
routing. This is what you want and need.

>In addition, the TNC would remain on at all times, and when it detects a

I don't think you can do this with TheNet, but it's undesirable anyway
since it makes the router one way only, IE no one will be able to connect
back *to* you from the outside.

Guys, Baycom v1.7 is a hoax. The Baycom guys in Germany have never released a 1.7 version and now never will. The v1.7 you have is apparently a hacked version 1.5 which of course does not have any of the new features found in version 1.6 which is the latest version.

If you can, I suggest you delete whatever files you have for v1.7. Who knows what virus the hacker may have placed in it.

> possible but need some details.

Yes, perfectly possible. You need to have a driver common to both progs,
mostly people use BPQ but in my case, I run the PE1CHL NET s/w with his
BPQ Hostmode Emulator to provide a BPQ type interface and allow NET to
supply all the packet switch facils.

The basic structure is to put the emulator TSR up high, load up DV and
then in one Window, run NET, then you can run up to 8 (same as the real
BPQ code) applications in different DV windows.

Just for the record, I run (quite regularly) here NET (the TCP/IP
transport and packet switch layers), FBB and JNOS (for it's NNTP stuff).
I have had running (as I suport NET in the UK) :-

NET, FBB, JNOS, DX-Cluster (two different ones whilst helping some
neighbour sysops to set up), traffic (a L2 stats prog that links to a
virtual stream) and the CHAT util.

It all runs nicely. OK, this is way more than most people will ever need
but it DOES work. You do need a fast machine to this much.

At the moment, there is a new release of NET and all my example files
need updating in the distribution archive. If you want to get a look at
it, you can find it on :-

ftp.demon.co.uk:/pub/hamradio/tcpip/NET-PC.ZIP

There is an associate text file too.

Cheers for now, Martin.

Thanks for all the replies, people. Perhaps you could point to a reading on TheNet? Perhaps I should restate my intentions..

Mount a mobile rig and TNC in the car. Leave both on at all times, provided the rig doesn't draw too much current in rx mode only. Otherwise, I'd have to leave the TNC on and have audio fed to it from, say, a solar powered crystal controlled receiver. When the TNC detects a connection request, it trips a relay that powers up the rig. Since [C]'s come in so many times, the rig should power up in time to respond before my laptop times out.

Then, telnet from my laptop/htx-202 to the car, access port ax0 (the only function I want available), and telnet/CONNECT out. I suppose I could get away with just using the TNC as a digipeater, but I don't like the end-to-end acks.

>I don't think you can do this with TheNet, but it's undesirable anyway
>since it makes the router one way only, IE no one will be able to connect
>back *to* you from the outside.

I'm only intending to have outsiders connect to my desktop machine back at the house. The car should only be my router/repeater when I need it.

Thanks again, and if anyone knows what's going on with the North Jersey IP coordinator, I'd like to know. An outstanding request I have with him is collecting dust.

Many thanks.

>send the Zenith back to the lease people.

I understand why you had trouble with the BayPac... It runs off the serial port, not the parallel port... If you were able to plug it into the parallel port, which you can't, it would never work... Hope you didn't buy an adapter for the parallel port and try and run it that way...

If you did plug it into the serial port and it didn't work, it may have been because the serial port wasn't turned on... Some serial ports are not turned on in normal operation in laptops... There is usually a command to turn on the port in the specialized operating programs for the laptop...

I had a BayPac for years and it worked on every laptop... I now have a PacComm because almost all laptops have DB-9 connectors for the serial port and PacComm sells a BayCom modem in a DB-9 shell... VERY small...!!!

P>FT301 AD solid state rig. My problem is when I try to operate HF, I can key
P>no more then 50 watts on cw when it is keyed through the computer.
P> (when I use my hand key, I can key up 100 watts) I am using a Macintosh SE
P>with a dummy terminal. This is driving me crazy!.
P> I also have a Radio Trash torroid choke on the line from the computer to the
P>tnc, and the tnc to the radio! Please Help me! I am killing to get on hf!

P> tnx fer all advice de N0ZYA

Try grounding the case of your PK-232 directly to your station Ground.
(You do have a GOOD station ground, don't you!?)

I encountered RF problems operating HF with my PK-232 until I did this.
I removed one of the side rear screws from the PK-232 case, scraped away
the paint in order to get good metal to metal contact.

Next, do the same with your computer case. This solved my RF problems.
I operate PACTOR on 80 Meters almost daily with no problems.

Note: I have heard some keyboards are susupectable to RF but I've never
encountered that problem.

Good Luck de AE4Q

Jack

348. How to upgrade the MFJ-1274 speed

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-23 13:33:04 UTC
From: pfund@uni2a.unige.ch
Message-ID: <1995Jan23.153304.1@ugun2a>
Source record: 45225

Hi,

Could someone tell me what needs to be changed in the MFJ-1274s TNCs to upgrade them to a higher speed. I suppose the z-80 and quartz have to be changed, but what else?

I'm asking this because I'm now currenctly running their 9k6 card and 19200 baud serial and I get a lot of re-syncs from the HOST. I guess upgrading the speed would help!

If you have ever done this, please post or mail!

best 73s,

Daniel, HB9VBC

Hello Everyone,

The W8YY Winter Carnival Special Event Station is being set up for
this year. As of now we are planning to operate W8YY for 24 hours
straight from Thursday Feb. 2nd until Friday Feb. 3rd. The times will be
from 6am Thursday to 6am Friday. The following frequencies will be used:
>From 6am to 6pm Thursday, 14.255 Mhz. From 6pm to 11pm Thursday, 7.255
Mhz. From 11pm to 4am Friday, 3.805 Mhz, and the last 2 hour will be held
on 7.255 Mhz again. We will also be monitoring 146.58 Mhz during the
operation period. Anyone wishing to contact us via Packet can log in on
144.09 Mhz to the MTUBBS. Certificates will be awarded to all stations
contacting W8YY during this period. Please send a large self
addressed stamped envelope, certificate sized if you don't want any
creases. The certificate is 8.5 x 11 inches.

Ok, check your manual for the FT301 and find out how much current you have to sink at the key terminal (or measure it with an ammeter in series with the hand key). The PK232 keying circuit can't sink much current, only a few mils, so it may not be turning the FT301 hard on when it keys. This will give the results you are seeing.

If this is the case, then you'll need to add a higher current keying transistor (darlington connected), or use a reed relay driven by the PK232 to key the rig. I normally use the latter approach anyway since it's polarity insensitive and will key anything that a hand key will key, even rigs that use grid block keying and several hundred volts on the key line.

The version you want is called X1J. The code, and instructions, are floating
around the net at several of the regular ftp sites. Perhaps someone else
can give you a definite address for a convienent site.

>Mount a mobile rig and TNC in the car. Leave both on at all times, provided the

>with just using the TNC as a digipeater, but I don't like the end-to-end acks.

Ok, you don't want to do that. X1J is a true *router*. All you have to
do is issue a ftp or telnet command from your laptop addressed to the
destination station. If you set the default route in the copy of NOS
running on your laptop to point to the X1J node in the car, it will then
automatically route your packets to the X1J which will then automatically
route your packets to the next correct node to reach your destination
station (assuming the X1J's routing table is correctly configured for
your local topology). This isn't at all like a source routed KA-node.
You don't have to connect to each link in turn. It works just like the
internet.

>>I don't think you can do this with TheNet, but it's undesirable anyway
>>since it makes the router one way only, IE no one will be able to connect
>>back *to* you from the outside.
>
>I'm only intending to have outsiders connect to my desktop machine back at the
>house. The car should only be my router/repeater when I need it.

Fine, you can use MX aliases to prevent stations from routing to your
laptop. You *do*, however, want a station you are ftping to to be able

to open the return connection to your laptop so a file can be passed.
(There are *two* connections involved in a ftp session, a control channel
originated by you, and a data channel opened by the other station.)
You *must* allow routing in both directions.

Hello,

Having read that BayCom 1.7 were available somewhere in the world, I
have sent a mail to dg3rbu, one of the programmers. Here is his answer :

From: DG3RBU @ DB0RGB.#BAY.DEU.EU
To : F5PJE @ F6BIG.FRHA.FRA.EU

Hello Eric,
this BayCom 1.70 is a patched version of 1.50, without new features and
of unknown origin. I was reported of virus problems too. Please warn
everybody to use it, I have posted some messages in the newsgroup about
6 weeks ago. I do not know who wanted to challenge us with that,
but I think this is about the 200st mail I write in this matter.

73s, Johannes

So if you still want to use it, you have been WARNED : BAYCOM 1.7 ISN'T
AN OFFICIAL BAYCOM VERSION !! THE NEWEST VERSION IS 1.60, AND THAT'S
ALL !

Vy 73s.

> Thanks a lot in advance
> Lapo IK5NAX

The 8530 may not be available anymore. But the 85C30 is exactly the same,
only better. You need to talk to Zilog, Intel, and/or AMD, as they all
still sell the part. The Ottawa PI card uses the 85C30, as does the Baycom
card (?). My AEA PK-96 and PK-232 uses the 8530. As does most every
Macintosh and Postscript printer ever built. Lots of products would go
hurting if the 8530 disappeared. The 8530 is a good part. Stay away from
the "enhanced" version, 85230, as I recall. The 85230 has had some problems.

>Someone have told me that Z8530 (SCC from Zilog developed as SCC interface for
>general microP similar to Z80SIO and Z8000 specific interface) is to old to be
>found.
>
The 8530 and 85C30 are available from a couple sources, and this part is
used in many current products. Zilog has an "enhanced" version called the
85230, but it is a single source part. For your application, that may not
matter, though. An older part that is hard to find is the Intel 8274; I
would avoid using that SCC.

360. NACEC vs. Amateur Radio misinformation!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-23 18:57:53 UTC
From: nacec@millcomm.com
Message-ID: <3g0u7h$tff@news.millcomm.com>
Source record: 45238

DATE: January 23, 1995
TO: All Amateur Radio Operators, North America!
RE: Correction of misinformation circulating on NACEC's view
of the use of Amateur Radio in disaster and emergency operations.
==========

It was recently brought to my attention the many people were under the impression that NACEC (The North American Center For Emergency Communications, inc.) was in direct competition with the Amateur Radio Community in the area of providing emergency communications for disaster and emergency relief operations. Further more, it was brought to my attention, that information was circulating within the Amateur Radio Community that the goal of NACEC was to replace all emergency and disaster communications support currently provided by the Amateur Radio Community.

I do not know where this information got its start, but it could not be further from the truth. It is the goal of this organization to provide emergency communications support to those non-profit organizations working within a disaster area and direct support of the needs of the victims.

It is also the purpose of this organization to help insure that these organizations through out North America are aware of as many communications options as possible that will help them to complete their missions of aiding the the needs of disaster victims.

It has alwayse been our belief that the first line of emergency communications within a community is the Amateur Radio community. The reason for this is simple: The local Amateur Radio Operators living within the community can respond to emergency communications needs within minutes following a disaster. NACEC may take a day or more to bring its resources to bare and start providing communications within the disaster area.

NACEC actively promotes Amateur Radio as the first line of local emergency communication, and will continue to do so!

Even though NACEC is being developed to provide rapidly deployable commercial emergency communications systems to any point within North America, there is NO way the NACEC can respond as fast as the local Amateur Radio Community when a disaster strikes.

To the point that NACEC is out to replace the need for Amateur Radio in the area of emergency communications. This is a bunch of non-sence. Anyone that is truely familure with the amount of communications needed following a large disaster will also realize that the Amateur Radio Community CAN NOT meet the entire demand. It is NACEC's function to increase the amount of availabile emergency communications within the disaster area to more closely

match this demand.

Many of our volunteers and supporters throughout North America are from the Amateur Radio Community. NACEC is being developed for the simple purpose of reducing the amount of human suffering and death caused by the shortage of available communications following a large disaster. Since the start of this undertaking, we have turned to the Amateur Radio Community for support and to build a working partnership in completing this mutual mission. This is beacuse I believe the Amateur Radio Community can relate to and in many cases has experiaced first hand the tremendious need and importance of emergency communications following disasters. For this reason, we will continue to seek the support and partnership of the Amateur Radio Community, throughout North America.

If you have any questions regarding NACEC or would like to help, please either e-mail me at nacec.millcomm.com OR write me at NACEC, P.O. Box 23057, Minneapolis, Minnesota 55423.

Warmest Regards,
Edward E. Addy (KE0EG)
Executive Director
The North American Center for
Emergency Communications inc.

From: szinski@prairienet.org
Message-ID: <3g10kt$1uq@vixen.cso.uiuc.edu>
Source record: 45235
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.misc

I just received official word from Johannes Kneip (DG3RBU) of Baycom that version 1.7 Baycom software is phony.

He urges everyone to remove it from their computer and to remove it from distribution. He states that there is the possibility of a virus contained in this bogus version.

Official word has it that v1.5 is the latest shareware version and that v1.6 is the current (commercial) version.

362. Baycom 1.7 = fake

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-23 20:24:09 UTC
From: rdavis@nyx10.cs.du.edu
Message-ID: <3g1399$ml0@nyx10.cs.du.edu>
Source record: 45140

A file called BAYCOM17.ZIP has been noted in this newsgroup as an update to the Baycom program. That does not appear to be the case.

Comparison with Baycom 1.5 shows that the SCC.INI file in version 1.5 and version 1.7 are essentailly identical. The 1.6 release, which is not freely distributable, has an SCC.INI file more than 10-thousand bytes longer than the 1.5 version.

Here are file lengths in the archive:

filename.ext Baycom 1.5 fake 1.7 real 1.6
PARA.EXE 21936 21936 23705 bytes
SCC.EXE 44258 44258 46105
L2.EXE 28368 28368 24329

I think that you can see that Baycom 1.7 is a fake and is no different

from Baycom 1.5

In the UK the AD7008 retails for about GBP 30 so, allowing for the usual
mark-ups, would probably be about $30 in the US. It even has the D/A
converter built-in, so saving a bit more cost compared to some DDS chips
I have seen.

367. more help with new TNC suggestions

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-23 23:58:40 UTC
From: twalker@acc.org
Message-ID: <3g1frg$j92@ns2.acc.org>
Source record: 45142

1200 vs. 9600

As a new HAM, I am in the market for a TNC. Several people have given great comments on whats out there. But the big question is: 1200 vs 9600 to start off with.

I can get TNC's for around $120. The AEA-PK12 & Kantronics KPC-3 to name two. I believe these are VHF/UHF only models.

The AEA-PK96 & the Kantronics KPC-9612 are both around $200. Still only VHF/UHF models.

The Kantronic KAM Plus is 1200bps but allows HP and is upgradeable to 9600? At least I think it is. Its around $300.

There are more, but probably for bbs operators and real advanced users.

What should I invest in for a first TNC. I do not mind spending the $$ if it is usefull and upgradeable,
I would not want to just throw $$$ away though. It seems that most systems are 1200.
Are people moving to 9600? I do want to get into tcpip with the the local operators here in the
Washington DC area.

Or should I get something inexpensive, learn with it, & then purchase the big (probably expensive)
TNC if I really get caught up in it?

Thanks, Tom / KE4UNL

>Thanks a lot in advance
>Lapo IK5NAX

Yes, the 8530 is one of the most used chips for HDLC. You can find one in
almost every TNC or PC board.

Here in the Netherlands the OptoPcScc card from PA0HZP is very much used. It
contains 2 Z8530 SCC chips and optically isolated i/o for the 4 modem
connections. The card is supported by a lot of software, including net, nos,
bpq, tfpcx, linux etc.
If you need more HDLC channels than the 4 on one board : you can chain as
many cards as you want / fit in your pc and still using only 1 interrupt
channel. If you want more speed / higher interrupt latency just plug in the
Z85230 whith the FIFO on chip. Of course the software has to be adapted for
FIFO use.

Hi,
I find it hard to believe that you dislike this type of simple modem.
We down under have had great success with this format. Maybe the design you tried was poor or was it original.
there are many around using the 3105 plus the one which is unique to Tigertronics in the States.

73s,

Charlie VK6ZCK.

Thanks fer the advice so far. I haven't had the time yet to do all these things yet, but my radio, tuner, and power suply is grounded so far.

I just discovered something this evening though... My 232 is wired directly to the mike when I do CW or any other mode.... I was going crazy so I decided to use the ol hand key. I tuned up my antenna (65' long wire) I got a flat match with the 232 plug plugged *IN* to the radio. I pulled the plug out of the radio, and my swr went to about a 1.5:1.
It's late tonight, so I can't work on any grounding probs, thanks fer everthing 73's de N0ZYA JP

The answer to most of your AMPRnet questions lies with the AMPR* files on
ftp.ucsd.edu:/hamradio/

One of the AMPR files there lists the coordinators.

At the time of this typing, their FTP server was down, but try it later,
at you should be able to get in.

For the hell of it, someone might even want to post it here.

I got a Baycom modem from our local packet group for $35, which included the group's $5 yearly dues. In this version you have to solder audio cables or connectors to the board and provide some kind of box. Hookup was easy and the software is great. What else can you get for those prices?

Can you tell where the RF is getting in ? Start by winding some of the
connecting leads around ferrite rings. Perhaps you can move some of the
RF leads around or try some different leads. If you are using an external
keyboard try sticking a ferrite rod down the coiled keyboard lead.

There aren't usually any magical solutions, but these sorts of tricks
usually work !

Good luck.

: : Is there a source for a 9600 baud mode for the Radio Shack htx-202 2m
: : handheld?

: There probably is but I hope you're good at micro-surgery HI.

I wouldn't exactly call it micro-surgery. It's a wee bit tight, but a steady hand and a magnifying lense was all I needed (and a soldering iron). Actually bringing the leads out of the case is the tough part, as it's pretty tight in there. Here's the how-to I've had lying around for some time. Obviously, I'm not the author, so credit where credit is due.

==========
From: Gene Kennedy <Gene.Kennedy@f470.n3625.z1.fidonet.org>
Date: Wed, 30 Nov 94 06:04:00 -0600
Subject: 9600 Baud
Organization: Di's Online Cafe - Mobile, AL - (205) 661-8945

To Steve and others who may be interested, heres how I connected my 9600 baud TNC to my HTX-202:

CONNECTIONS TO REALISTIC HTX-202 FOR 9600 BAUD PACKET

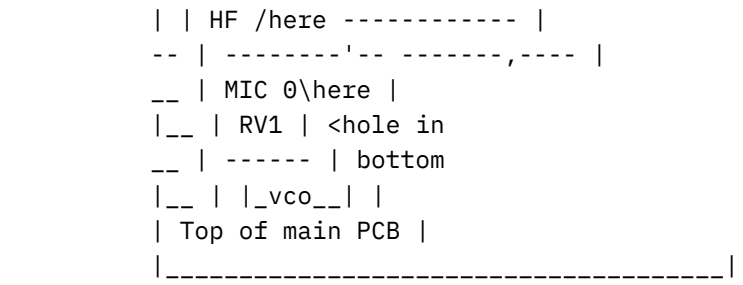
NOTE: The following operation requires soldering in very close quarters and damage or destruction of your radio is possible if you get too much heat on nearby wires or components, or by sloppy soldering.

I performed these operations on my own HTX-202 and it works OK for 9600 baud operation with my new Kantronics KPC-9612. I don't take any responsibility for invalidation of warranty or improper operation of the radio, etc.

I studied the schematics and determined the locations for making connections based on general recommendations for 9600 FSK. I didn't want to permanently deface my radio by making any holes in the case for wire penetrations, so I removed the battery and battery connector which is a plastic oval with a spring contact in it held by two screws and ran the wires out to the connector that goes to the TNC. I can restore it to original condition in just a few minutes. I used the smallest coax I had avail, I think it is RG-174. Someone may have a better idea about doing that part.

Open up the HTX-202 by removing the five screws, take off back cover, and separate front panel and lay it on bench so that flex pc cable won't be damaged.

Knobs _____
\ __ | |



This is a crude diagram of the inside of HTX-202 after splitting case and folding front case aside. There are several sub-PCBs standing on edge that I represented by the dashed lines. In my HTX-202 the sub-board at upper left is labeled HF and the raw output from the discriminator IC goes into pin 1, the first solder pad starting from the center of the radio. This is where I soldered a small coax and ran it out the hole in bottom of case. This is Receive Audio into TNC.

The sub-board labeled MIC is microphone audio to modulator varicap. Pin 6 here goes directly into the VCO and this is where I soldered a second coax. The solder pad 6th pin from center of radio is right next to the RV1 deviation pot. (Dont melt the pot.) This is Transmit Audio from TNC.

The third connection, PTT, is harder to describe the actual point. What I did was flip the radio over and used a ohm meter to locate the solder trace from the center pin contact of external mike socket. It runs from just below mike socket to a small SMD resistor. I soldered a 2k resistor here and ran a tiny wire from other end of it, along the side of radio and out a slot in case where the cover wouldn't pinch it, and through the hole in the bottom.

The radio now has to be operated by a power supply, since the battery contact is gone and the wires are coming out the hole in the bottom. I lengthened the power wire that was removed from the contact and connected it to the same power supply as my TNC. The coax and PTT wires go to the DB15 connector for the KPC-9612. I used the coax shield for RX Audio as the ground connection, but left the TX Audio shield un-grounded at the DB15.

I am still in the process of evaluating how well this works on 9600 baud packet. There are very few VHF 9600 baud stations near me (only one, in fact) but hopefully in the future this will change.
Good luck, and I welcome any feedback about this.....

Gene, WA4WBI
==========

....rvz here again....

I followed these directions, and receive works just lovely. I've only managed one connection though, not sure if it's a problem with the hookup, or just my measly 30 watts not doing the job. Much like Gene, I'm having a hard time finding other 9600 activity close by. Anyone know of activity in

the Northern 'burbs of Chicago?

Couple of notes... Although it's probably necessary to pull the front
off the radio just to identify the proper points, I made my connections on
the rear of the board that's exposed immediately after removing the back
cover. Be careful with the routing of the rg174, paying attention to what
will be crimped when replacing the cover. A friend smoked his when he
screwed the cover back on (what's an ERR 01 mean?), piercing the cable with
one of the ic pins. I also didn't bother running the PTT cable out as Gene
describes. I put a plug on the end of PTT lead from the TNC, and use the
microphone jack on the radio instead.

good luck,
rvz N9ORG

The 8530 is still available. Either from AMD or Zilog with various
prefixes and speeds, and some CMOS versions (AM85C30). There are a few
quirks with their behaviour so beware!

Failing that, the Siemens/AMD 82525 seems to be a nice chip (although I
have never used one).

I recently bought a second-hand PK-232. It is one of the older models, without any new proms or extras. I'm unable to copy the majority of the RTTY signals though. When I issue a 'sig' command, the system responds with the baud and 'synchronous'. Is the PK-232 unable to receive these signals, and if so, does anyone know if I can purchase add-ons that will? Does the newer PK-232MBX break out these signals, or for that matter any TNC?

UUUUrrrrggghhhhh ...

This message had me racing to the great white telephone in the bathroom.

Before I reach for the ink-pot filled with oil of vitriol, may I enquire whether this post refers to `repeaters' i.e. those dreadful things you access with a mobile or handheld using voice FM. Or does it refer to packet radio `repeaters' i.e. nodes, hubs, routers etc ???

I have heard it said that portable and mobile packet operations are not permitted in the U.K. since there is no way (if you implement the AX25 spec correctly) of appending the legally required /P or /M suffix to an AX25 packet callsign.

73,
Gareth.

Hi,

Can someone mail me the gif file that has the circuit diagram on
how to build this?

Also, if anyone can point me to some small source code that runs
a protocol (xmodem, kermit, anything really simple and tight) I would
appreciate it. I'd like to be able to build two of these modems and
experiment with sending files back and forth. AX.25 is too big for the
micro-controller I have.

Thanks in advance,

Raj

> I would like to know its title and other information.

Put simply, the AX25 protocol replaces ethernet etc. as a transport for
IP frames. In amateur radio, IP frames, and the layers above are compatible
in composition to those found in commercial practice. The use of AX25
as a transport is officially `known' as a transport hardware in the spec
of ARP request and reply

The AX25 frame has a maximum capacity of 256 data bytes, and a netrom
transport frame has a capacity of 236 bytes. Fragmentation at
`hardware' level may take place if an IP frame including header exceeds
these levels, so most amateurs keep their frames shorter than those
found on the internet, and packet <> internet gateways often
fragment frames destined for amateur radio at IP level just to be sure.

There will probably be a few other replies to your post, but I recommend
Ian Wade's book "Nosview" which is available from the RSGB, and quite
possibly from the ARRL too.

> Thanks a lot in advance
> Lapo IK5NAX

No, the Z8530 is still available and current. These are available in
NMOS and CMOS derivates (the CMOS ones being denoted as Z85C3008PSC for
a plastic cased, standard range 8Mhz clock version).

There are two newer uprated devices being the Z85130 and the Z85230,
both of which are CMOS only. The Z85130 is best avoided as it is
reported to have slicon bugs and the Z85230 is often cheaper than the
earlier models.

The Z85230 has larger FIFO beuufering on Tx/Rx channels - being 4/8
bytes as opposed to 1/3 bytes on the generic 8530's.

There are many advantages on the Z85230 that make it a much more
attractive device to use (particularly as it's usually cheaper) and is
capable of much greater speeds and/or reduced interrupt overhead
especially on fast links where high speeds can saturate slower CPU's

The Z8530 is capable of 38,400 baud and the Z85230 has been tested over
radio links at 76,800 baud full-duplex. The actual devices are capable
of very much higher speeds than this but how fast depends on your
driver code, especially on interrupt driven I/O.

Incedentally, the ESCC (Z85130/Z85230) as it's called, is s/w and pin
compatible with the generic 8530's and provide's a drop in replacement
for the parts.

I have no connection with Zilog, just a satisfied customer who's used a
lot of them. AMD also make an uprated part as well called the Am8530H and
have an Am85C230A which has Local Talk support.

Hope that helps.

Cheers, Martin.

393. NET_Mac2.3.47.sea.hqx.text

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-25 09:30:05 UTC
From: adam@iag.TNO.NL
Message-ID: <9501250930.AA06244@iag.tno.nl>
Source record: 45168

The Netherlands, January 24, 1995.
Hello dear reader,

Today I distributed NET_Mac2.3.47.sea.hqx...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac I implemented the following:

- Show hostnames in ARP console-output
- Minor mod to the 'ping' console output
- In case of I/O-errors also display interface-name
- 'ttylink' command = 'chat' command
- 'traces' command = 'trace' command, but packets are separated
- Non-ADB-keyboard Macintoshes had 2 active 'Quit' File-menu items
- With 'ignore bad headers' OFF the bad-headers-counter is now zero
- Mods to fix an appleshare-mail-delivery problem
- Some mods for ROSE and low-level AX.25 as suggested by K5JB

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim archives.

The new NET/Mac has (hopefully) been uploaded to:
ftp.ucsd.edu, to the directory hamradio/packet/tcpip/incoming.
If it's not there then look at hamradio/packet/tcpip/mac.

Scott WY1Z may have also uploaded the new version to:
oak.oakland.edu, to the directory pub/hamradio/mac/digital

Kind regards and (maybe a little early...) Merry Xmas and a prosperous 1995,

Adam PA2AGA (e-mail: adam@iag.tno.nl)
(or: pa2aga@iag.tno.nl for letters only, NO BIG files here)

> AX25 PY3BAM@PY3SS.RS.BR.SA
> INTERNET sermon@vortex.ufrgs.br

I looked in my archives and found I had a schematic for an IC-45A/E, and after studying it for a few minutes, I'd suggest one of three places to connect 9600 baud TX audio.

1) Connect to the same place on the VCO as the TX audio. This looks like it might be a small feedthrough capacitor on the VCO case.

2) Connect on the main board at P3 - where the TX audio leaves the main board to go to the PLL board.

3) Connect to pin 1 (hot) and pin 3 (ground) of J8 on the main board. This is where the IC-EX270 accessory was intended to install. R108 will affect your TX deviation, and may need to be adjusted. If you are unable to get sufficient deviation with the modem output and R108 at maximum you will either have to short out or remove and jumper R109, or use one of the other connection options.

As always, when you modulate a PLL it attempts to correct for what it perceives are frequency errors in the loop. These are of course the information you are trying to convey by modulating the radio. If the PLL loop filter constants are designed for too high a frequency the PLL will distort the 9600 baud TX signal, resulting in poor performance. While I am not skilled at calculating the effects of the filter I see in the schematic, I notice that it is a dual time-constant system, one where when the loop is in an unlocked condition, the loop filter capacitor is capable of being charged or discharged at a more rapid rate than when the loop lock detector considers the loop to be in a locked condition. This being the case, you may find the loop characteristics acceptable, or to be easily changed without sacrificing quick lockup of the loop when changing from TX to RX and RX to TX.

Also - no guarantees this will work - I don't have one of these radios - I'm not sure why I have the schematic, but since I do, and I've set up a number of radios for 9600, you now have my best estimate of what can be done.

Somewhere on the net DRSI indicated they will continue to support the
amateur products already sold.

From my PCPA manual, address is:

Digital Radio Systems, Inc
2065 Range Road
Clearwater, FL 34625

(813) 461-0204 (voice)
(813) 447-4369 (FAX)

I know the address is fairly good - I picked up some stuff when visiting
relatives there about a year and a half ago. All things considered, I
probably should have left a resume there too...

I too am using a DRSI with NOS. Specificly I'm using a PCPA type 2 card with the True DCD kits installed on both ports. This is running on a 486DLC/33 with two additional serial ports to two 9600 baud TNCs. I'm using Novell Dos 7 and JNOS 110h, and the PE1CHL (?) generic SCC driver, as modified in that release of NOS. After being up for 3 1/2 days, I've the following report from sccstat:

Ch Iface Sent Rcvd Error Space Overr Rxints Txints Exints Spints
0 14760 142144 44170 120299 281 0 4221964 10177876 468644 92566
1 22456 9213 55591 50821 208 0 5321352 809736 481864 69339

My station is set up currently to act as a public router between 3 of the 4 radio ports, plus ethernet to the area domain name server, but due to some configuration issues, you see the result of routing packets from some lans via my station, with the return route via another.

It's been a while since I've looked at the source code for the scc driver, but the easy ones are:

Sent: Number of packets transmitted on this interface
Rcvd: Number of valid packets received on the interface
Error: Number of packets recieved with errors
Rxints: Number of interupts from the recieve data interupt (bytes of received data/errors)
Txints: Number of interupts from the transmit data interupt - bytes of data transmitted.

Overr: Number of over-runs. A number other than zero indicates that
your computer got too busy to service all the interupts before
there was an RX hardware overflow (and possibly a TX hardware
underflow), causing a packet to be lost (RX) or damaged (TX).

I've been running the DRSI card for about a year, and for my 1200 baud
ports I've been happy with its performance. I wish I'd gotten a couple
of the 1200/9600 baud cards while they were available.

Hope the above helps. 73, Bob

It's the same. All the programs that you use on the Internet can work
over packet, but typically with pretty poor performance due to most
packet links not being very good. You can go between packet, Internet,
packet again, Internet again, etc... transparently.

: > ... If anybody knows of a good book specifically comparing the
: > amateur radio versions of X.25 and TCP/IP with their wired counterparts
: > I would like to know its title and other information.

: Put simply, the AX25 protocol replaces ethernet etc. as a transport for
: IP frames. In amateur radio, IP frames, and the layers above are compatible
: in composition to those found in commercial practice. The use of AX25
: as a transport is officially `known' as a transport hardware in the spec
: of ARP request and reply
:
: The AX25 frame has a maximum capacity of 256 data bytes, and a netrom
: transport frame has a capacity of 236 bytes. Fragmentation at
: `hardware' level may take place if an IP frame including header exceeds
: these levels, so most amateurs keep their frames shorter than those
: found on the internet, and packet <> internet gateways often
: fragment frames destined for amateur radio at IP level just to be sure.

Connected AX.25 has that limit, non-connected frames do not. Systems like
KA9Q NOS and Unix systems with AX.25 in the kernel typically can run these
larger packet sizes and nearly everyone who runs 9600 or higher using
TCP/IP use much larger packets than 256 bytes. Backbone links typically
can run ethernet size frames with no problems.

>
>Isn't it possible to use the JVFAX receive modem in HAMCOM?
>According to the shematics it appears to be the same modem.

>
Gert, I don't know which schematic you have for the interface, but it should include a full-wave bridge (you can use 1N914 types) between the UA741 Vcc+ and Vcc- pins and the computer connection. At times with one program or another, the polarity becomes reversed and will not supply the op-amp properly. I had the same problem and found help on this newsgroup. BTW, it would be a good idea to include a .1ufd cap across the Vcc pins of the op-amp to decouple RFI.

> AX25 packet callsign.
> 73,
> Gareth.

Reading my license conditions it does not require each AX25 packet to be suffixed /M, /MM, or /P. There is a requirement for voice or CW identification every 30 mins and if you wish to be pedantic your call sign should be in the MESSAGE area of an AX25 packet every 15 mins with /M,/P,/MM.

Para 7.1.d of BR 68 release AR1 July '94 makes this clear.

I am sorry if you are confused and hasty.
Of course I did not mean to imply that Data links
should be in the form you propose below, The
Objective of my post was that the manufacturers
of black boxes make good profits from their products
and should protect their market by chipping in towards
the provision of Repeaters/Hubs for all of the modes that
their sales rely upon. After all they are in Clover.
And you are being intolerant of other peoples chosen poison
with your asinine comments about mobiles
Data and voice could co-exist on a single channel if the
work and development was done. That would be a legitimate
application of the self training aspect of the license.
I am aware of at least one *data repeater* <generic class>
that has closed, solely because of lack of financial support.
Much to the chagrin of the sys op.

Yep, that's right. Various types of 8530's are available. Look in the Farnell
catalogue for example (I don't know if they have an agency in Italy).
Averaged price here in the Netherlands is approx. 20 dutch guilders which
is approx. 7 UK pounds or about 10 - 11 U$.

411. HELP:Getting modem to work without phone line

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-26 17:38:14 UTC
From: "William H. Parker" <whp1@Ra.MsState.Edu>
Message-ID: <Pine.SUN.3.91.950126112215.18213C-100000@Isis.MsState.Edu>
Source record: 45091

I was wondering how to get my modem (a USR Sportster 14.4) to put out a signal through its phone jack without being connected to the phone line. I just started fooling with digital communications through radio a few weeks ago, and I want to connect the jack to a simple transmitter and receive it on another computer through a receiver connected to its modem. I have some experience with electronics and computers but virtually none with digital communications, so all of that probably sounds silly.

Thanks,
Will

AD7008 is available with either a 20MHz or 50MHz clock. I have a couple
of 50MHz parts, although they are still in the anti-static tubes they
arrived in :-((when I have the time.......)

It is quite a fancy chip - it will allow FSK (two input words where you
can switch betwee them), add a phase offset, which allows PM, and also
allows I/Q AM, although it sums the resultant so you only get one
output.

Look for a file called SIO142.ZIP on compuserve or AOL or maybe somewhere else. I found it on compuserve. It includes new serial drivers to replace COM.SYS and VCOM.SYS. These new drivers add better support for the 16550 UART.

G'Day Will

I guess the first hurddle that you'l come up against is getting the modem
to an online state without talking to another modem. This may be possible
but you'd have to read the manual for that. Try this set up using an
amplifier or somthing that will prevent the receiving modems signal from
getting back to the transmitting one. If this works then try it through
the radio link, however you may well find that the link does not have
the bandwidth to support this type of operation.

It works fine here with no problems. I always have color and
never have to go to DOS to view anything from PaKet 6.0 or 6.1 in color.
And the colors are configurable within PaKet itself.

419. Possible Kiss Bug in KPC9612

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-28 02:02:20 UTC
From: gareth@lightfox.demon.co.uk
Message-ID: <19950128.020220.26@lightfox.demon.co.uk>
Source record: 45101

This message may be of interest to users of the KPC 9612, and who
make use of the `extended KISS' facility in conjunction with
G8BPQ node, and tcp/ip software.

I've recently been checking out a Kantronics KPC 9612 which is needed
for duty in a G8BPQ node. The software version appears to be 5.2

A bug manifests itself when `XKISS' mode is selected, and checksums
are enabled with the XKChksum command. The checksum byte appears
to be appended to the kiss frame heading for your JNOS/BPQ or WHY,
but this byte always appears to have a value of zero.

All comments and observations welcome !

73,
Gareth.

Wrong, the legal requirement is for morse or voice identification.
You can put whatever you fancy in the AX25 packets, although most people
prefer callsigns.

> ---
> * CMPQwk #1.4* Y

John

I have a Code3 RTTY decoder which decodes more modes
than most of the decoders available in the U.S. However, the
majority of signals I encounter are still not decodable. Many
of the 75 baud signals found in HF are not Baudot at all but
Nato and Navy users sending synchronous 8 bit based codes. Many
monitors refer to these as "encrypted baudot" which they
certainly aren't, they may be encrypted (who knows, you can't
decode them) but they are not baudot. Most of these stations
also routinely mask the bit pattern so it also appears random
to statistical analysis.
Baudot is "asynchronous" because each character is sent
with start and stop bits. In the case of baudot some of these
bits are longer in duration than the data bits. The PK-232 can
sense the bit duration and can identify Baudot by this feature.
Generally, if the baud rate is 75, 100 or 110 and synchronous,
it will be undecodable by any of the decoders available.
Which is not to say that there are not plenty of
decodable RTTY comms, you just have to look for them. The
"Guide to Utility Stations" by Klingenfuss is a great tool for
tuning RTTY signals, once you've found a signal, you can often
just look up the frequency in the guide and read the mode. He
is able to decode a wide variety of modes and the loggings are
very complete.
There are many embassy stations that still use
conventional Sitor-A, which is the same as Amtor. I'm sure this
is included on the 232. Almost all the maritime comms in the
world are on sitor-A, Sitor-B, and 50 baud baudot. I'm sure
you'll find much to monitor with the 232.

Translation : Mark Bitterlich, WA3JPY
Reprint : Pierre Cornelis, ON7PC

Lately it seems we are hearing more and more stories about hams who are having trouble using their local node or digipeater. It seems that the user has no trouble hearing the digi, but the digi doesn't seem to hear the user at all. The symptoms almost match those where the receiver at the digi site is either dead or close to it. While that kind of failure is always a possibility, it is not the subject of this article.

The condition that this paper will talk about is one where the above symptoms do actually occur, but not from any lack of receiver sensivity. Instead it is due to the digi's receiver hearing too many signals all at once and the remote user pretty much gets lost in the "noise".

The reason for this becomes obvious when we consider that while all the users may hear the digi/node just fine, they in many cases don't hear each other. Thus in some cases, more than one station will transmit at the same time causing packet collisions. This situation is referred to as "a hidden station" problem, and for remotely located users access to his or her favorite digipeater become difficult to impossible during rush hour periods.

This is not a new problem, and in fact there are other services experiencing the same difficulties. A real world example is ships on the open sea trying to gain access to a communication satellite.

Several different experiments have been made to overcome this dilemma on amateur packet radio. One possible solution that is being pursued is through the use of full duplex digipeaters (BTMA), however there are several disadvantages to this approach. In a full duplex the hardware expense will normally be much higher and the system will occupy two frequencies but will only realize the maximum throughput of one. A better approach might be to increase the throughput by reducing the collisions on a single channel system rather than spreading the load onto two channels. It would be ideal if we could incorporate a system that did this with something so minor as software change (such as replacing the EPROM in a TNC) or by changing some operational parameters.

One of the methods used that attempts to solve the hidden station problem while still using a single frequency is called DAMA (Demand Assigned Multiple Access). A description of this method follows.

In a connection oriented protocol environment, an end user will try to connect to the master (satellite) by means of a slotted ALOHA method (channel access without any coordination). Collisions might occur during this phase but they are tolerable since they are relatively rare. Once a connect request is recognized by the master, the connecting stations identification is added to the polling list and from this point on the master controls all connected stations. Permission to send data is granted by means of polls which might be included in ACK packets or even in transferred data frames. so in this case a user will only be allowed to transmit after receiving "permission" in the form of a poll sent from the master station. Once permission is granted several frames might be transmitted in a block. However, if the user does not respond within a given time frame (say around 1/2 second) then the master assumes that the poll got clobbered or the user never received it for some reason. The master then passes permission to to transmit to all other active stations and when completed comes back to the first user and gives him another chance.

On the other hand, if the user (slave) actually receives the poll and replies with sent I frames, the master will not acknowledge them until the next time around after serving all the other active stations. If when polled by the master, the user responds with an empty frame (Receive Ready/Final), then the master will reduce the user in polling priority and will skip him on the next time around.

As the activity on the frequency increases, the polling priority of inactive users might be further decreased, but when these stations respond with an I-frame they will again regain their original priority.

If you understand the description just given, you might think that you are reading about AX.25 level 2 protocol and this is why DAMA has a chance of working over amateur packet radio. AX.25 L2 provides all the protocol elements that are needed to implement DAMA and no new syntax is required. Most of the new functions required could be obtained simply by patching existing operational parameters while the rest could be achieved by making some minor changes to the TNC's firmware.

So how do we actually go about incorporating DAMA using AX.25 protocol ?

Due to the fact that there are no new syntax elements required, the following description will only use standard AX.25 terms. Since CSMA (Carrier Sense Multiple Access) as well as DAMA is used, please interpret all future references DAMA as CSMA-DAMA. The term "poll" used throughout this text in no way refers to the poll bit in the control field of packet frames and this bit remains unchanged to ensure compatibility. The different phases of the protocol will be described separately below.

Connect Establish :

When a node attempts to connect to a user, the node adds the users ID to it's polling list and begins to send SABMs to that station. If after a certain amount of tries no UA is received, the user is assumed to be inoperable and is removed from the polling list.

When a new user starts a connect sequence to the node, he begins by sending SABMs to the master in a simple CSMA manner duplicating the existing method used today. Collisions are possible during this phase, so it might be necessary to repeat the SABMs several times until the node replies with a UA. Once the node recognizes the users connection attempt, the users ID is added to the polling list in a fashion very similar to the one used by TheNet nodes (TheNet userlist) and the node (master) is now in control of the uplink users station. After the user sends SABMs and the node replies with a UA, the user replies with an RR0 to signal to the node that it had a successful reception of UA.

Idle state :

As long as no information transfer occurs between user and node, (idles) then the node sends its polls as an RR with the corresponding count. If the response by the user is just an RR#, then the time until the next poll to the user will be lengthened to avoid unnecessary channel load. The exact amount of time added is determined by the total channel activity.

If information transfer by other users on the node is high (as determined by the number of I-frames being sent) then the amount of time added before the next poll occurs to an inactive station is longer than in cases where there is only very little channel activity. Thus when the frequency is basically clear, the waiting times are reduced to a minimum so that no decrease in channel throughput takes place. This is the principle of the self-alignment mechanism of DAMA, where a channel is always regulated to insure its maximum possible throughput.

If the node ever fails to receive an RR from the user (due to a collision of the nodes poll or the users RR response) then the node will proceed on to the other stations on its polling list. The node will come back and try this station again after all the other users on its list have been serviced. If after a certain number of transmitted polls this station still has not answered, then it is considered to be unavailable by the node and is dropped completely from the list. This is analogous to those "keep-alive

polls" that we have today.

Data transfer : Node --> User :

There is no difference between regular CSMA and DAMA in this case. Because it is always up to the master (node) to act first, it could send one or more I-frames or a poll to the user. The user will acknowledge I-frames immediately with an RR#, but could also send its own I-frames with the corresponding count (having to correct the count on the sent I-frame serves the same purpose as an ACK with AX.25). The meaning of the Poll/Final bit remains unchanged.

Data transfer : User --> Node :

As mentioned before, the node will send polls to all users that are uplinked to it and the user will not respond until it receives this poll or an I-frame from the node. It may be wise to point out that when a user is polled he must always come back with some kind of response, even if it is an RNR#. If the node fails to hear any kind of response from the user then it assumes something went wrong (such as a collision) and moves on to the next user on its polling list.

This method of always waiting for a poll before transmitting is the central aspect used to avoid collisions in a situation where hidden stations exist. This is in contrast to the usual CSMA method where several stations can actually transmit at the same time. Additionally the problem of deadtime collisions is resolved. Deadtime refers to the period from when the TNC realizes the channel is free and starts transmitting, to when he has been on the air long enough for other TNCs to recognize his carrier. This is really not a rare case, as exemplified by the case where two or more TNCs are waiting for a digipeaters carrier to vanish so that they can leap on the frequency. Using DAMA the node will not acknowledge received frames the instant it hears them. Instead it will first service all other uplinked stations and then come back with an RR# to the sending stations I-frames along with a poll to that station. This poll basically says "Have you got any else for me ?".

Disconnecting :

If the master intends to cut the connection, it will send the usual DISC-frame to the user. The user will then promptly respond with the UA-frame (final bit set). If the node fails to receive the UA and again sends a DISC-frame, the user will respond with a DM-frame. This is identical to the actual CSMA version.

When the user wants to disconnect from the node, he will wait to send his DISC-frame until polled by the master. AT this point it makes no major difference whether the node responds to the user right away with a UA or goes through another polling cycle to do so, however an immediate UA is preferred.

UI-frames :

In CSMA as well as in a DAMA environment, the UI-frames are treated in a special way. I.E. These frames are used to carry some information besides the regular protocol traffic. Normally UI-frames are never sent from a user to a node, and it is not good headwork to make a habit of making UI-frame direct QSOs on the input frequency of a node. However, in contrast to a duplex system, it is possible to actually do this. So although the rare UI-frames will reduce the throughput to the CSMA value, it will not drop the much lower ALOHA value that would occur with a duplex digi having a QSO on its input frequency. UI-frames originated by the node are no problem since all stations receive these frames.

Other protocol elements :

So we have gone from the beginning to the end in describing a complete DAMA session. We have not translated each and every AX.25 element into one that has a special significance to DAMA. This is not required since many of them will keep their initial meaning. DM, RNR, REJ, etc will all be used as they were before. The only deviation from the pure CSMA version is in the fact that the users will only be allowed to transmit these frames after receiving permission from the master (node) in the form of a poll. The node will only transmit these frames after all other users on its list are served by completion of one polling cycle.

Compatibility of DAMA and CSMA :

One advantage of the DAMA method is that it does not require everybody to change everything all at once. However as additional users convert their TNCs to work with DAMA the more pronounced will become the increase of throughput. Even stations that are waiting to switch over could help to increase the areas throughput by changing a few operational parameters. For example the delay between the reception of a frame and the TNCs response (sometimes called T2 or DWAIT) should be reduced to a value under 1 second. In addition the time interval from when an I-frame is sent to when the TNC sends an RR# to ask for a pending ACK, should be set to a value that is clearly higher than the time between two polls of the master (usually more than 30 seconds at 1200 Bd).

To fully benefit from DAMA both the node and the user must work together in the master/slave relationship. Assuming that the users TNC is capable of both the normal and the DAMA mode, there still remains the problem of how to tell the user to "turn DAMA mode on". There are several ways that this could be done:
1. Automatic detection of the protocol version by means of the protocol identifier byte or reserved SSID-octet-bits of the node (preferred version).
2. Implementation of a channel specific parameter which controls the protocol version.
3. Implementation of a new UPLINK command besides the current CONNECT

command.
4. Implement a further protocol element such as a SABM-frame (similar to X.25) so that at connect time the node could alert the user to the increased features.

In case #1 of the above it would be sufficient to tell the user to switch DAMA mode only once, at connect time. This state would then remain in effect until disconnect. However since there is no PID field in SABM-frames this information has to be carried in some other way, such as utilizing the dormant bit 5 of the master's SSID address field. It is proposed that DAMA test versions set this bit to 0 to convey the necessary information to the users TNC.

Conclusion :

The existing AX.25 version was established in 1982 when packet radio was not widespread as it is today. Most stations in the beginning were pretty much equal and there was no distinction made between DTE and DCE functions. However with the implementation of wide area networks not all stations are performing the same function. In fact today the network nodes are acting in DCE function considering their control and information exchanging aspects. These functions will be better served with the implementation of DAMA.

The methods discussed in this article could increase the throughput on an AX.25 channel tremendously. One advantage is the avoidance of system breakdown which occurs with channel overload. Using DAMA, the throughput will increase continuously up to its maximum. There is no foldback effect like that which occurs using CSMA where at a special limit (above ca 60%) the throughput is actually reduced.

There is also a strong "social" aspect of DAMA wherein even the weak stations can work through the node reliably without being overpowered by stations close to the node.

It is possible to make direct connections with other HAMs on the uplink frequency unlike that of a duplex system. In addition the users TNCs still retain the digipeater capability inherent in our present simplex system. All protocol elements keep their original meaning which allows both versions to be utilized on the same frequency, yet throughput increases as more and more users switch over to the new method.

---------- July 24, 1992 ---

Note by DB2OS: The full DAMA protocoll is implemented in the latest
version of TheNetNode (TheNet for PC) as a DAMA MASTER
and TheFirmware (WA8DED Hostmode for TNC2) as a DAMA
SLAVE by NORD><LINK. DAMA is also supported by TFPCX, a
resident AX.25 software TNC for the PC (only external
Modem required, no TNC) and by TFKISS (former TFPCR).
TFKISS emulates a TNC with TheFirmware and any TNC
can be used if it can be switched into KISS-Mode!!!
DIGICOM and BAYCOM Software also now supports DAMA.
DAMA is now used on several german TNN digipeaters and
the results are of great promise.

>Invariably the user'll upgrade to a full blown TNC for WEFAX,CW or any of the

that the buyer will invariably upgrade says something right there. where
the problem is is misrepresenting a modem as equivalent to the classic
TAPR TNC-2. If you already have a computer to spare for the job, great.

but if you want to run in some other environment than plain old dos,
things become much more diffcult.

obviously a full up multimode controller may exceed the budget of
someone just wanting to get on packet. i think the baycom type solution
is interesting, but isn't for situations where multiple people have to
use the same equipment...for a while, we actually had a situation
where equipment type didn't matter -- what you learned using a PK-80
applied to other manufacturer's products.

now you get guys that think you have to have a special program to do
anything on packet (and the software guys have to answer for that...)
especially for those programs that leave the TNC in a "hard to talk
to" state...(a friend has a PK900 that has to have it's mate program
running to convert what used to be MYCALL WB9IVR into whatever
cryptic string it wants...when his computer was kaput for a week,
he was kaput, even tho he had other equipment that could talk RS-232.
all because somewhere along the line, someone decided that window
dressing was no longer optional.

(aside -- it's quite possible the PK-900 can talk in english as a
TNC 2 could. I've never found where you set this up in the book tho.)

that's probably why i don't do much in packet these days...when it
lost the universialty the "dumb terminal" interface had and didn't
pickup anything useful in exchange, i figured i didn't want to get
into the study of the Mysteries of the Shift-F8 key for the program
of the week.

SimTel/msdos/hamradio/
qlog203e.zip SpotDx log and Packet terminal integrated

Quick Log is a Packet terminal program integrated with SpotDx capture and
more. It provides complete logging of stations with all options needed
for archiving. The terminal allows interchange of data from RS232 and
the log. The program works in all modes with a Kantronics modem and can
be configured by the user for other modems and TNCs.

Special requirements: None

qlog203e.zip has replaced qlog116e.zip.

I'm having same problem here. Wrote down the Error message: SYS3170.

Help message from Warp said the user program had generated a
"DOSRaiseException".

Have had the BPQ switch (version 4.08) on the air. Works fine.

Let me know if you solve this.

Hi;
I recieved this lovely little note from Pete deVolpi at amsoft. You read it and decide if this looks like a noncommercial entity publishing a noncommercial newsletter, or a business advertising on the 'net. Pete says it clearly--he thinks I'm attempting to restrain amsoft from doing trade!! Would he think or say something like that if he *WASN'T* doing trade???! You decide. I guess all further criticism of these guys best be done thru the offshore anon servers.... Imagine a thousand corporations just like this one, puking terabytes of commercial ads into the net. It'd be tough just to find the real traffic through the junk mail.

Gert, I am using the HAMCOM intrface wth JVFAX and it works OK.
The JVFAX interface, I am told, won't work with HAMCOM because
it does not have the two electrlytic capacitors accross the power
supply diodes. If you install them (10-22 microfarad will do), it
will be fine.

Pardon me for jumping in here but.....I wanted to give packet a try
without spending a lot of money. So, I bought a Baycom. It does a fantastic
job for what I want. It works great with my laptop and my XT. I especially
like the 3 window split screen. Other packet users that have seem my demo
at club meetings also seemed impressed. I bought a Kantronics KPC-3 to use
on a gateway to Internet. I tried it at home with the crummy software that
came with it. Personally, I prefer the Baycom. Sure, it doesn't have
mailbox or BBS capability, but, so what? I don't need that ALL the time!

I've made contacts all over the world with my Baycom and Icom 2AT. It's
a lot of fun dropping into a qso halfway around the world with my indoor
2 meter antenna and $50 "TNC".

Have fun, and 73 de "A.C.", W5EZM in Houston, Texas

436. W8DED protocol for the pk232

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-29 12:24:24 UTC
From: jrr@nwu.edu
Message-ID: <3ggma2$qmt@news.acns.nwu.edu>

At least the new(er) PacComm tnc's no longer need the jumper lead to pin
1 of the eprom.

439. HELP design data network on 218-219 Mhz

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-29 14:35:52 UTC
From: z007742b@bcfreenet.seflin.lib.fl.us
Message-ID: <3gg948$9f8@bcfreenet.seflin.lib.fl.us>
Source record: 45120

Help design a new 2-way data network on 218-219 Mhz. This spectrum has recently been licensed for Interactive Video & Data Services (IVDS). We have a clean sheet of paper within the following parameters: 1. Multipoint to point only (ie. multiple users to 1 base station) 2. 20 watts max ERP 3. 2 licensees per MSA, each gets 500 khz.

This spectrum is great for an interactive return path, where many users can respond in a short period of time if we use very small data packets.

This system requires the integration of several things: 1. data-ready radios for 218-219 Mhz. 2. high speed modems. 3. Some type of time synch of all users to allow the use of TDMA to prevent contention/collission (ie. GPS receiver at base station that sends out time signal on a recurring basis). 4. Software on the base station computer to consolidate and route all the responses. 5. Software for the actual applications.

Example of an application: Electric utility sends out request for meter reading. All users send their meter reading. Base station consolidates those responses and sends full list to power company.

440. Please, I want more commercial postings!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-29 14:58:32 UTC
From: MARK@ardsley.business.uwo.ca
Message-ID: <MARK.1393.2F2BAD18@ardsley.business.uwo.ca>
Source record: 45121

There have been alot of negative comments in regard to commercial postings. I think they are a great idea. The universities can't give everybody a free ride forever. I make money by connecting small businesses (the backbone of america) to the net. The more commercial postings the better for me.

I believe his address ended in .net

Most likely he pays big bucks for this advertising medium.

So, for those who want to think the internet is packet radio with a 'no commercial usage restriction', I would suggest that you go back to packet radio and leave the rest of us alone.

In the meantime, THIS SPACE IS FOR RENT!

ps: Let me guess, you DON'T buy QST for the radio ads, right?

Well you would think its a great idea, your making money from it.
For everybody else its a lousy idea.

>I believe his address ended in .net
>Most likely he pays big bucks for this advertising medium.

He pays a tiny fee like everybody else, and agravates a large population.
If he is paying big bucks, its only because you are ripping him off.

>So, for those who want to think the internet is packet radio with a 'no
>commercial usage restriction', I would suggest that you go back to packet
>radio and leave the rest of us alone.

The internet has traditionally been non-commercial, though its legal
now, there will be a strong resistance against it.

Everybody hates TV commercials. If you were to add up all the time
commercials waste in ones lifetime it would be a substantial sum.
I don't like the idea of having to pick through messages
to kill off commercial advertisers. Fortunatley there is device called
a "KILL file" that automates the process, and will help kill the
commericial advertisers off. I predict that each news groups will
have a commercial FAQ annedum that any user can use to kill off
offending avertisers postings.

>In the meantime, THIS SPACE IS FOR RENT!

Thats the beauty of internet, I don't have to give you any *space*.
Well, you've made my KILL file, adios forever.

Actually, they don't pay me for the service. I work for an university and consult for local businesses. I connect their business via slip to a variety of internet providers. These people then setup www servers on their own hardware. These are not individuals using winsock/slip machines but businesses with their own registered domain.

My position on this stuff is this: The internet WAS academic. Academic=government=limit finances. The government doesn't want to foot the bill anymore. The business world is starting to see the internet as a means of advertising.

We as users of the internet can not push back the flood waters. We will have ads. Like it or not. May as well learn to live with it. AOL is pushing accounts to anyone with a working credit card.

If we want bigger, better, faster networks in the future, someone has to pay the bill. Don't think that your $6/hour slip account (or whatever it costs) is actually paying for infrastructure upgrades.

back to ham stuff.... From time to time I buy QST. I don't get pissed that more than one half of the mag is ads. Quite frankly, I find the ads more interesting than the endless contest reports. If someone has some neat ham related product available, I want to know about it.

In response to the guy who put me in his killfile... great! At least I wouldn't have to hear from him again. I get far too much email now (I am the postmaster at my site).

I believe was your president that started the big 'information highway' push. Do you think it was for students to discuss radio and DoomII?

Anyways, this is just my opinion. I don't want to start a fight, but I am willing to argue the point in a friendly but heated discussion. Hell, come to London and we can argue face to face over beer and chicken wings (loser buys hi!)

There is a packet gateway at "wsu1.n8fow.ampr.org" that has such a
conference. Do note you have to be a licenced amateur first before accessing
this gateway, and you need to get an account created there before you can
use the facilities.

There are more of them around, perhaps someone can follow up? Thats the only
one I have.

>available in the western US.

To reduce the RFI, you don't really need -metallic- paint. I'm sorry I don't have the right name of it with me, but open up your -computer- casing, I'm quite sure the front panel is made of plastic. On the inside, you'll find it sprayed with some black, rough material thingo. I think that would be the stuff you can try looking for inside a paint can, and use that instead.

Hope this helps.

Rgds!

: businesses with their own registered domain.

WWW servers are fine. But that isn't commercial postings to this group
is it ? If one of your clients provides a product or service that I
need or want and I choose to visit their WWW page(s) to find out
about it that is one thing. But if they, and every other business
with a connection (and registered domain ? what difference does that
make ?) decide to post an ad or 2 to this and a few other newgroups
then that is completely different.

: My position on this stuff is this: The internet WAS academic.
: Academic=government=limit finances. The government doesn't want to foot the
: bill anymore. The business world is starting to see the internet as a means
: of advertising.

This is all true. The Internet *is* commercial. The old academic
AUPs are mostly gone. *But* that doesn't mean that advertising in
random newsgroups is now or ever will be acceptable. People
read newsgroups because they want to read about particular topics.
Not because they want to wade thru random ads. I suspect that in
the long term people will come to accept ads that relate to the
topic of the newgroup (and in fact this is the norm in many
groups now)

And don't think that the "Internet" covers the world. It doesn't.
Not yet. A lot of people still get their news through other means.
And even where news is passed over the "Internet" they have to
pay usage charges.

: We as users of the internet can not push back the flood waters. We will have
: ads. Like it or not. May as well learn to live with it. AOL is pushing
: accounts to anyone with a working credit card.

This doesn't mean that ads are inevitable.

: If we want bigger, better, faster networks in the future, someone has to pay
: the bill. Don't think that your $6/hour slip account (or whatever it costs)
: is actually paying for infrastructure upgrades.

But I'm willing to bet that the people doing the advertising now
aren't paying for it either. Your right, someone has to pay and the

"Internet" as we know it is just an intermediate step. Commercial activity is guaranteed. But I don't think that will mean unrestricted advertising on our favourite newsgroups. I for one will just "tune out".

: back to ham stuff.... From time to time I buy QST. I don't get pissed that
: more than one half of the mag is ads. Quite frankly, I find the ads more
: interesting than the endless contest reports. If someone has some neat ham
: related product available, I want to know about it.

Which rather relates to what I said earlier. In the future people will probbaly get used to seeing ads for things related to the topic of a particular newgroup. Off topic ads will be shunned.
(How many non-ham (and non-public service :-) ads were in QST ?)

: London and we can argue face to face over beer and chicken wings (loser buys
: hi!)

Gee next time I'm down that way I'll let you buy me some :-)

Interested in Standard C1208DA/Sprint-2 TNC
I want to use this with a Mac Plus to access Internet Gateways and the
Oscar satellites (someday). I would like to start my own gateway also.
questions:
1. What NOS should I use on the MAC?
2. Where is the best place to buy?
3. Any other radios/TNC 's to consider?
4. Anyone in the Salem/Portland area into Packet out there?
Thanks for your help!

Hi Steve,

Sorry to say its not possible, as the PK-232 has only one modem and only
two serial data ports - one is used to talk to your computer. The
front panel switch simply selects which connector is connected to that
modem. If you have to have dual port simultanious operation, you're
going to have to spend the money that support requires.

From: g6jpg@gec-mrc.co.uk
Message-ID: <3gitep$d2d@miranda.gmrc.gecm.com>
Source record: 45047

I don't know about the TCP/IP standard(s), but the main difference between X25 and AX25 is that AX25 packets contain the addresses of both sender and receiver, whereas X25 only contains one of them (I'm not sure which) □. (Please excuse odd characters - I don't know this editor properly.) Also, the AX25 packet frame can include up to eight (I think) `via' stations, for digipeating; I don't know if the X25 standard includes this.

Incidentally, can anyone point me at actual CHIPS that implement X25? I have an application for work, using quite high-speed data, and I'd like to know if X25 is a viable possibility - or AX25, for that matter.

470. Microwave computer links

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-30 19:44:54 UTC
From: "Todd Owen"
Message-ID: <3gjfjm$bla@freenet.vcu.edu>
Source record: 45049

I was wondering if anyone here has any experience with
microwave computer links.

I would like to construct a 10 Mbit ethernet link with someone
a few miles away on 10 GHz or above.

The only microwave equipment I have seen is the 10 and 24 GHz
Gunnplexers, but they seem to only support SSB voice and CW.
Although I have seen statements that high speed data
connections are possible on these bands, I haven't seen
any plans or further discussion anywhere.

Any assistance would be appreciated.

471. Accessing Linux via packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-30 20:10:33 UTC
From: peg20@hermes.cam.ac.uk
Message-ID: <3gjh3p$d1r@lyra.csx.cam.ac.uk>
Source record: 45050

I want to set up a packet connection from a Linux system, so that I can access my machine remotely. I need to have some prog or other which will take the raw (HOST/KISS) output from the TNC (on a serial port) and strip the conversation out, sending it to a shell, and returning any output from the shell back to me.

Has anybody out there written / got such a program, or have any clues about how I would go about it, and if so, could they email me the details etc...

473. ANNOUNCING: Kentrol 5.0 with SkedMan now available!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-01-30 20:28:41 UTC
From: brian@kentrol.synapse.net
Message-ID: <brian.2.00147AFF@kentrol.synapse.net>
Source record: 45058
Cross-posted to:
rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.shortwave,rec.radio.amateur.equipment,uk.radio.amateur

The leading edge in rig control software just moved forward!

Kentrol has a new version 5.0 and a new partner, SkedMan.

Kentrol is a Windows 3x control program for Kenwood HF transceivers and the R-5000 receiver, which has built-in logging and memory management capabilities. Since its introduction in 1991, Kentrol has set the standard for Windows-based rig automation and new features continue to be added regularly. SkedMan is an automated sked manager for Kentrol. Enter schedule data, set alarms and when an alarm goes off, SkedMan uses - even launches - Kentrol to tune it in.

Kentrol and SkedMan are shareware, so if you haven't tried them you are most welcome to do so.

You can obtain both programs by anonymous ftp from:

ftp.synapse.net/shareware/kentrol

The filenames are, oddly enough, kentrl50.zip and skedmn10.zip.

There is also a Kentrol site on the World Wide Web, for those who have WWW access. At that site you can read the documentation and preview the interface, as well as download the files. The URL is:

http://www.synapse.net/Kentrol/Kentrol.html

Kentrol is also available from major radio-related ftp archives worldwide and on CompuServe, and there are linkds to the Kentrol Web page from all the best ham & swl pages.

Try it. You'll like it!

>
>| ARS N8NYU |

For Starters, Steve, a PK232 is not dual ported... It is simply
a single port tnc with a SWITCH... (No More, No Less)

Look at the schematic.....

The mod would basically be (BUY another TNC)!!!

(Not a flame, just the facts!!)

I think the only AEA TNC for which a WA8DED eprom is available is the PK-87.
You might try running the TFPCX tsr program with KISS, which will work with SP
at least and possibly other software which uses the WA8DED protocol.

I (and my site) are under no obligation to pass commercial messages around. Given reasonably well-written software, fine-tuned through experience, and we can simply fail to propagate commercial messages.

The step after that is to pass only those commercial messages whose authors have paid a fee to us.

We're not doing this yet. We're not even planning to do it yet. But we CAN do it, and where will your Information Super-Shillway be then?

Pissing into the wind isn't very effective, you know.

In article <3gjh3p$d1r@lyra.csx.cam.ac.uk> peg20@hermes.cam.ac.uk (Pete Glasscock) writes:

I want to set up a packet connection from a Linux system, so that I can
access my machine remotely. I need to have some prog or other which will
take the raw (HOST/KISS) output from the TNC (on a serial port) and strip
the conversation out, sending it to a shell, and returning any output
from the shell back to me.

It shouldn't be too hard to modify the "listen" code that comes with
Alen Cox's AX.25 packect drivers for Linux to do this.

: >>
: >Mark, does the advertiser pay you for connection or by the word for his
: >ads? I didn't know that they were not getting a free ride. Let us know
: >how this works.

: >Ken

: Actually, they don't pay me for the service. I work for an university and
: consult for local businesses. I connect their business via slip to a
: variety of internet providers. These people then setup www servers on their
: own hardware. These are not individuals using winsock/slip machines but
: businesses with their own registered domain.

: My position on this stuff is this: The internet WAS academic.
: Academic=government=limit finances. The government doesn't want to foot the
: bill anymore. The business world is starting to see the internet as a means
: of advertising.

: We as users of the internet can not push back the flood waters. We will have
: ads. Like it or not. May as well learn to live with it. AOL is pushing
: accounts to anyone with a working credit card.

: If we want bigger, better, faster networks in the future, someone has to pay
: the bill. Don't think that your $6/hour slip account (or whatever it costs)
: is actually paying for infrastructure upgrades.

: back to ham stuff.... From time to time I buy QST. I don't get pissed that
: more than one half of the mag is ads. Quite frankly, I find the ads more
: interesting than the endless contest reports. If someone has some neat ham
: related product available, I want to know about it.

Well.... maybe he has a point there! Since QST has "dummied down", the ads
are the only part of QST that really interests me. I remember reading some
old issues just for the projects and learning by them the radio theory for
putting them together. Well, that is pretty much gone now in favor of many

endless contest crap and other brain dead dribble that fills it's pages in most issues now. AND TO TOP THAT OFF - IT COSTS MORE TOO! Is internet in a similar tail spin now? Time will tell.... As for the ads???? That is where I go FIRST now in QST since they had "dummied down" the magazine.

: In response to the guy who put me in his killfile... great! At least I
: wouldn't have to hear from him again. I get far too much email now (I am the
: postmaster at my site).

: I believe was your president that started the big 'information highway'
: push. Do you think it was for students to discuss radio and DoomII?

: Anyways, this is just my opinion. I don't want to start a fight, but I am
: willing to argue the point in a friendly but heated discussion. Hell, come to
: London and we can argue face to face over beer and chicken wings (loser buys
: hi!)

> * Origin: the LIBERAL VOICE bbs (1:3632/69.0)

Perhaps I shold be more precise. The bbs I use can use what it calls the
color mode. when this mode is enabled the ansi characters that it
transmits are not interpreted properly by Paket and the garbage ansi
chars clutter the screen instead of causing the correct ansi action to
be performed. It seems that the Paket program needs to be configured
to understand that ansi.sys is available. My Paket screens are already in
color, I just need to make it understand ansi codes. Hopefully its all
clear as mud now ;>)

You might contact Kantronics if you are having problems with this.
We ran across this here in the Portland network.

Kantronics does have a fix for it, and I suspect they will supply a
prom with the fix if you need it. I suspect the fix will appear in
the next release of the kpc-9612 firmware.

We just recently discovered this problem, contacted Kantronics,
and they were most helpful in providing immediate work-arounds
as well as an update prom that fixed the problem.

From: pethyvar@utu.fi
Message-ID: <D3BA9u.JID@utu.fi>
Source record: 45086

HI!

I am using F6FBB 5.15c version in 286, 2MB, 12MHz, two 1200bps ports in BPQ with the DRSI-card. The software will crash in infinitely time. Thus, you don't know when and why. The screen saver asterisk is blinking OK, but nothing happens when pressing console keys. The only thing you can do is to turn off the computer. With the earlier versions there weren't any problems.

I tried to minimaze buffer lines in init.srv, but it doesn't get any solution.

Has someone solved the same kind of problem?? There is also other sysops here in Finland who has the same problem. Or is it the only thing which I can do to make watchdog to harddisk light.

> I'm only a resident of California. It ain't home.

There are also numerous internet gateways around the world. They
generally have used one of the flavors of NOS which includes either
IP/IP tunneling and/or IP security. Our local system currently uses
JNOS running on a 386sx and is sited at a local internet service
providers' business. Another in the area is actually provided by a
person in the service provider business, and a third is located at a
commercial company which maintains a full-time internet connection.
Typically these systems are piggy-backed on the ethernet used to connect
the various computers at the specific sites.

Mail is usually handled directly - i.e. if you know the ip address or
the host name, you just send it in the same fashion as other internet
mail. In my case (the radio gods willing) mail for me can reach my
machine at home by being sent to 'bob@kd7nm.ampr.org'.

The approach that N0ARY uses is to provide a mail gateway to the old-style AX.25 PBBS mail system, for those hams on packet, but not (yet?) using TCP/IP protocols, or not on a 'connected' network.

I know there is a mailing list for the operators of amateur<->internet gateways, but as I'm not the responsible party locally, I don't have the information on the host or subscription method. If you are not subscribed to 'tcp-group' or 'net-sig', I'd suggest them as a place to learn further about what's being done. Also, I know that someone involved with managing the 'gateways' mailing list reads those lists as well - mentioning your desire will probably get you subscribed.

I don't have the subscription instructions handy, but probably someone reading does and will chime in.

511. ACARS on 131.725Mhz

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-01 13:07:21 UTC
From: jerry.teahan.0401093@nt.com
Message-ID: <jerry.teahan.0401093-010295134009@ngalm202.gal.nt.com>
Source record: 45006

Hello there,
I am not sure if this is the correct place for the following question but I am having a lot of trouble finding info on ACARS transmitted on 131.725Mhz. I think ACARS stands for Aircraft Communications Addressing and Reporting System. My question is what form does the data transmitted on this frequency take?? i.e. is it C.W., Serial, FSK etc. Perhaps a micro could be used to decode the data and send it to a P.C. for further more user friendly decoding. Is there s/w already available to do this?
If another knows anything about the above I would appreicate it if you could e-mail me at

gipxd01@nt.com

Thanks in advance!!!!

>endless contest crap and other brain dead dribble that fills it's pages in
>most issues now. AND TO TOP THAT OFF - IT COSTS MORE TOO! Is internet in a
>similar tail spin now? Time will tell.... As for the ads???? That is where
>I go FIRST now in QST since they had "dummied down" the magazine.

Well, I've been reading QST for nearly 20 years. I can certainly
say that QST isn't as technical as I would like, but I'm not sure
that QST has "dumbed down". In fact, over the last few years, I'd
say the content has improved; for example, look at Rhode's series on
receiver design last summer.

Don't forget that what appears to be a "dumbing down" may actually
be a "smarting up" on the behalf of the viewer. Even if a level of
technical content stays relatively constant, it may look like it
has become lower as one becomes more experienced. 20 years ago, QST
was pretty technical for me. Now, it isn't technical enough, so I
also read QEX, Communications Quarterly, and old issues of Ham Radio :-).
In retrospect, I'm not sure QST has changed all that much, but I know
I have.

Since this thread has little to do with digital amateur radio, I've
set followups to rec.radio.amateur.misc.

[P.S. William, don't be afraid to edit down text when you are quoting it.]

517. Problem with KPC-3

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-01 17:42:00 UTC
From: Jack.Anderson@f239.n109.z1.fidonet.org
Message-ID: <fac_9502020603@blkcat.fidonet.org>
Source record: 44997

Hello,

I'm having a problem with my KPC-3. With Procomm connected with a 9600 baud DTE speed, I can monitor traffic, display MHEARD and the DISP parameters. But, when I connect to anything, including other stations or the local PBBS, I get garbage. The TNC continues to respond to my commands, but they are not properly echoed to the local terminal, and any activity that comes in as a result of the connection, including data, CONNECTED messages, etc. is garbage. I can still issue CNTL-C and DISC commands, then I get back to a normal display with the ability to monitor traffic and DISP restored. Anyone have any ideas why a KPC-3 would go into garbage mode only when connected? I did a power cycle, RESET and a RESTORE D, and I'm ready to do a Pin 7 hardware reset if all else fails.

Thanks,

Jack N4ULS

|> >america) to the net. The more commercial postings the better for me.
|>
|> Well you would think its a great idea, your making money from it.
|> For everybody else its a lousy idea.

You do not speak for me here, please stop claiming that you do.

I too am part of "everybody else", and have NO problem with
advertising on the net.

<junk elided>

|> Everybody hates TV commercials. If you were to add up all the time
|> commercials waste in ones lifetime it would be a substantial sum.

I don't watch the commercials on TV unless I *want* to watch them.
I don't read bulletins on packet radio that do not interest me.
I skip right over usenet articles that are not of interest.
I turn past that advertising pages in magazines when those
advertisements are not of interest.
I look away from billboards that are not of interest.
I throw away junk mail while walking from the car to the door.
There are entire SECTIONS of the newspaper that hit the recycle
pile as soon as they arrive.

Is this a big deal? No. It's trivial.

So folks please stop whining about how "the net" "should not
carry any advertising". "the net" is just as much a commercial
enterprise as any magazine, newspaper, etc.

Get used to it.

Get mosaic running and have a peek around the real world ...

... Hank

Hi Pete:

I am running a version of JNOS under Linux, that does exactly what
you are asking. :-) It can be retrieved from ftp.ucsd.edu.

The set-up is fairly simple. Establish a CSLIP connection (using
DIP, slattach, etc.) to a pty on the Linux side. In JNOS, establish
a corresponding CSLIP connection back to the pty. Voila! A user can
then connect to your machine by telnetting through the CSLIP connection.

I've had this set-up running for a few months, now, with no problems.
In addition, I use the POP3 client in Linux to retrieve any mail I have
from the AX.25 BBS, so I can read it using elm, pine, etc. Rather
neat. :-)

If you want exact details, I can send them to you later, since I'm at
work now.

521. Re: NACEC vs. Amateur Radio misinformation!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-02 03:04:14 UTC
From: wb6w@netcom.com
Message-ID: <wb6wD3Cr72.2q8@netcom.com>
Source record: 44999

hmmm...NACEC sounds like a fine idea. It does have one serious flaw, however. Local agencies typically are LOATH to trust their communications to anyone other than themselves during an emergency. In recent years they have been increasinly receptive to emergency assistance from the local Amateur radio community, but ONLY because local hams have worked with and been trained by the local agencies. Folks who just show up out of the woodwork are typically assigned to monitor the water level in local creeks (if the disaster is a fire) or to watch for smoke (if the disaster is a flood). Get the point?

The other aspect of the "market" that NACEC seeks to address is the modern communications systems are VERY robust in an emergency situation. For example, after the Loma Prieta 'quake in '89, the phones worked just fine in the disaster area, excepting only a few small areas. Incoming phone calls were restricted, but that was the phone system acting as designed, to avoid an overload due to the whole country "calling aunt Milly to see if she felt the quake." I understand the situation was similar iafter the Northridge quake a year ago.

A national organization to coordinate backup emergency communications is an excellent idea. That's why the ARRL organized what is now called ARES, the Amateur Radio Emergency Service, several decades ago. Apart from duplication of effort, why do we need a second organization?

It seems that we have a bit of evolution going on here. There is a major difference between internet and traditional info media (TV, radio, news papers etc.) in that internet is a two way street and the others are not. Those who choose to advertise on internet, be it via a web page or by spamming newsgroups, will get nearly immediate feedback. If the ad is considered by the recipients to be too intrusive, the least the advertiser can expect is no business - more likely he/she/it will get a LOT of mail from folks who aren't buyiing anything. Advertisers with no sensitivity to the wants and desires of their potential customers will not last long. That will be true on the net as it has been in other media. Advertisers who have sensitivity and "class" may well become rich - and what's wrong with that?

I suggest that the appropriate response to inappropriate advertising is to send the offending creature a note, stateing your opinion of their ad and a pledge to NOT purchase any of their product. THEN BE SURE YOU DON'T PURCHASE THEIR PRODUCT!!

Is this a bit of a nuisance to you, the net.denizen? Sure, although you might have a canned response for this kind of thing. The advantage is that it will be a BIG nuisance to the offending advertiser because he/she/it will have to spend at least enough time to read your note to determine that it is not an order. Multiply that by however many other people were annoyed by the ad and you get the idea!

Given a bit of motivation, the net ads could become both entertaining and enlightening. IMHO, the recent StuporBowl was a boring waste of time, but the ADS were worth watching!

525. TNC Network with no radios?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-02 05:13:54 UTC
From: jlarson@micron.net
Message-ID: <jlarson.11.005C9F82@micron.net>
Source record: 45003

Has anyone every experimented with hooking several TNC's together (audio transmit and receive lines parallel) all to the same pair of wires and seeing if you can communicate? I think in theory it would work, but was wondering if anyone had actually tried it.

I am needing to communicate over a 2 mile range and there are some dedicated phone wires available to tap into. A total of 4 TNC's would be hooked up to the same pair of wires.

Will it work? Thanks in advance for any input.

35th Lafayette Hamfest
March 10-11-12, 1995
Holidome - Holiday Inn Central
Lafayette, Louisiana

The 35th Annual Acadiana Amateur Radio Association (AARA) Lafayette Hamfest
will be held at the Holidome just south of the intersection of I-10 & I-49.

There will be commercial dealers, a flea market, technical forums, tours for
those interested in the area's attractions, the famous AARA fox hunt, and
plenty of Cajun hospitality.

The Quarter Century Wireless Association (QCWA) Cajun Chapter #189 will host
a dutch treat breakfast buffet at 8:00 a.m. on Sunday, March 12th.

FOR MORE INFORMATION:

If you'd like to find out how you can reserve swap tables, or pre-register,
or attend the V.E. test session, or anything else..... Please contact:

529. ### I've got a Baycom modem - Now what?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-02 12:01:30 UTC
From: s2202629@np.ac.sg
Message-ID: <3gqhiq$52n@nova.np.ac.sg>
Source record: 45009

I've recently put together a baycom-type modem, and have gotton onto packet.

It's a good modem to get started with (low cost), and right now, I'm taking a look around to see what are my s/w alternatives.

What other s/w are out there that I can run with my baycom-type modem? Also, what are their most current versions? I'm interested in
a) Terminals
b) Mailbox (personal or multiuser)
c) bbs
d) Anything else (?)

s/w which can run on a XT is a plus, but is not required. For c), s/w which can support landline modems (ie: 2 nodes, 1 packet, 1 landline) is also a plus, but not required.

I've looked into:

Baycom 1.5 [Terminal]
mubaycom 1.01 (Multiuser Baycom) [Terminal + multiuser mailbox(reg feature)]

I've got TFPCX 2.10, but I haven't a clue what I can do with it (mubaycom uses it)

I'm interested in shareware prgms I can ftp off the net, to see what suits me best before putting any money down (if I had cash from the start, I wouldn't have homebrewed the packet modem!).

mubaycom looks attractive, but I'd like to see if I have any other alternatives. I've -heard- of a) Eskay packet, b) Superpacket, c) Graphic Packet, but am not sure if they are shareware, if there are, could someone point me to where I might be able to find them.

I'd also like to know what is the most current version available for each of these s/w.

Finally, besides all these mentioned, are there -any- other s/w I can use to run my packet modem on?

Feedback desired. Please post or email.

Thank you.

PS: Is there a faq for baycom modems on the net? If so, pointers please...

An associate of mine is looking for information concerning the following Radio data transmission
protocols (I'm quite interested too)

RDIS
CDPD
DSRR
MOBITEX
MPT1317
MODACOM
RDLAP

Any pointers to references or just general descriptions would be appreciated. Along a similair
line, are there any emerging standards for the point to point transmission of data over the Radio's ?

Thanks in advance.

But you do. If you want to watch *anything* you must at least wait
through the commercials to see what you want. Whether you watch
commercials or not, they consume your time while watching TV.

>I skip right over usenet articles that are not of interest.

Wait till 1/2 the articles are commercials and see how much of
your time you waste "skipping" over them.

TO turn on the modem for transmitting, just do a ATO. THis will start
the transmitter going. On the other end you will need to do a ATA.
As for doing this over a radio link, you may need to have two seperate
TX/RX, since most standard modems are duplex systems. Unlike a TNC-2 which
operates in half-duplex mode.

>If another knows anything about the above I would appreicate it if you
>could e-mail me at

If you can, find the ARINC 618 specification, and there are a few other
pertinent ones as well. ARINC= Aeronautical Radio Inc.

ACARS is 2400baud MSK. One half cycle of 1200Hz is a transition and one full
cycle of 2400Hz is no transition (or vice versa, I forget). There's a very
short preamble, a header frame (which contains things like the aircraft's tail
number, etc.), and then the message portion. There's a lot of mundane stuff
that goes over ACARS, and the airlines can basically put anything they want in
the message portion of the structure. It can be scrambled, encrypted, totally
stupid...anything.

539. Re: Please, I want more commercial postings!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-02 21:53:51 UTC
From: waf@sunfish.zk3.dec.com
Message-ID: <WAF.95Feb2165351@sunfish.zk3.dec.com>
Source record: 45020

Others have already pointed out the distinction between web servers and newsgroup postings, the distinction between single or infrequent postings and frequent postings, that newsgroups are carried by non-internet means, and the possibility of various forms of software to eliminate postings which we feel are commercial.

I'll add that I get QST only because it is not separable from league membership, but even they have a table of contents listing only the articles, so that I can page right to the articles, and not read the ads unless I'm in the mood. I do buy (better example) Computer Shopper *for* the ads. But that's my choice. I only read the ads when I'm looking for something specific, using the index. Many issues get tossed (or used to wrap things for shipping) without being opened. In contrast I find newsgroup ads, like telemarketing calls (well, maybe not quite that bad), to be intrusive. Some may not see a distinction. Some may truely enjoy reading ads in newsgroups, but couldn't they have separate newsgroups, to which I need not subscribe? Right and wrong is not the issue here. The issue is whether we want to be subject to these kinds of marketing tactics.

For those of you who, like me, don't want to have advertisements in the newsgroups we read, don't want our intimate moments interrupted by telemarketers, don't want to pay for FAX supplies for the printing of advertisements (I have a longer list of marketing peeves but I'll stop here), the question is what do we do about it? My answer is to hit them in the pocketbook. I keep a list of companies whose marketing methods offend me. While there are times when there is no choice, I make an effort not to buy from any of them. When friends ask for product recommendations those companies aren't included, again unless they are the only viable alternative. If pressed as to why one of those companies isn't in my recommendation I respond that I "don't like the way they do business", which is the God's honest truth.

If a substantial part of the population took these attitudes I think the problem would eventually be self correcting. You don't have to make a marketing plan illegal if you can make it socially unacceptable. But I hope to hurry things along. I write (E-mail or postcard or FAX, as appropriate) explaining my policy, including the fact that companies that seem to have, from my point of view, "mended their ways" will be removed from my "not-recommended" list. If you choose a similar approach let me suggest that you take the time in a moment of calm to compose a generic correspondence to send. The "wit" and "venom" that can creep into writing done in a moment of passion is unlikely to improve the impact of the message (I freely admit to

having failed in this resolve many times).

If we don't have a ton of new advertising traffic, maybe
traffic levels will be low enough so that we can do without the part
of the network "upgrades" that would have been paid for by the
advertising subscribers. (How does that work again? My access fees
(I do have a personal account as well as this account for which my
employer pays) don't pay for network overhead, but if I posted an
advertisment to a bunch of newsgroups, for which my provider would not
charge any extra, then somehow my access fees would pay for network
overhead? I guess that you have to go to a business school to
understand it.)

Please feel free to copy my methods and/or text. Please feel
free to improve it WITHOUT attribution.

According to an article in the latest issue of RadCom, direct access
to the US packet network is provided by e-mail to gateway-request@lbc.com
with callsign, first name, last name, town, country and postcode all
on separate lines. Another gateway which operates similarly is
gateway_info@arasmith.com.

I have been using JVFAX a bit and have found that you need to load
VESA driver to get the program to respond in COLOR. Simply load the
VESA TSR that should have came with your video card and then
set up JVFAX for VESA mode video.

Why not simply set the TNC into transparent mode and plug it into an agetty
serial port? Landline modem simulation is transparent mode's raison d'etre.

Message-ID: <791792689.AA00833@fluxline.mi.org>
Source record: 45028

I've been curious about this for some time. Given the bandwidth/deviation restrictions on standard 2meter and 440 FM, what really is the highest data bit rate than anybody has been able to sustain? What type of modulation do they use?

If I'm not mistaken, the phone company allows about 5khz bandwidth on their voice lines, which, if your lucky you can get 28.8kbps through. Could this be
done over the radio?

Source record: 45030

There's been some discussion on these lines on the uwave list at ucsd (sub ham-uwave to ham-uwave-request@ucsd.edu).

I'm also considering this. My inital thoughts were:

Before 10GHz ssb, most activity was speech, done as you say by modulating the Gunn voltage. The tune sensitivity is around 10-30 MHz/V I think, and they used to use 10.7 MHz broadcast FM type detectors, with .3-1MHz bandwidth. AFC back to the Gunn was common to remove thermal drift. Handbooks from the late 70s/early 80s probably describe this stuff.

The 1991 ARRL handbook has a 2Mbit/s link, using Gunnplexers. You choose a pair of frequencies, spaced by your IF, and work half-duplex. The interface was the standard MAU as used on Ethernet (right down to the 15pin D connector). It used a MC10335 FSK receiver chip, which may be hard to get now. I believe we should look at the PLL decoders made for sat TV, which use 13MHz deviation. The plessey SL1451 PLL should give 10MHz data width (it can run 27MHz deviation). What I'm interested in is a point-to-point 10 MBit/s link, driven by standard ethernet cards. Is anyone else interested?

Gunnplexers are very scarce/expensive in the UK, I'm wondering about the polarplexer technique. Here you transmit and receive on 90 degree spaced polarizations. The RF head I saw drawn used a (723) klystron as the source. The 'waveguide' was a bit of 1 inch bore Cu water pipe, with one end closed, and a mixer diode horizontally. The klystron probe went in vertically, and screw at 45 degrees coupled the necessary power to the mixer. A LOT cheaper than a circulator. (The tube bore is quite critical, I recall the working frequency range for circular waveguide is only about 1.2 to 1). This was in an old RSGB VHF handbook. I wonder if we can do something similar with Gunn diodes.

--

N6GN (ftp://col.hp.com/hamradio/packet/n6gn/index.html) has a www page describing various faster packet bits, including the ARRL 2Mbit link. I believe the speed limit on that rig was the FSK chip.

I'm still lacking any info on the waveform put onto thin ether cables, and whether we can use it, what its bandwidth it etc. I can't get hold of the IEEE 802.3 standard.

As least in the UK we would have to put <20wpm morse or speach identification out as well.

Anyone else interested/experienced in this area ? Should further discussion move off r.r.a.d.m. ?

550. ### I`ve got a Baycom mod

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-03 12:31:51 UTC
From: f5pje@stdin.gatelink.fr.net
Message-ID: <1995Feb3.123151.4412@stdin.gatelink.fr.net>
Source record: 45031

Hello,

S2>What other s/w are out there that I can run with my baycom-type modem? Also,
S2>what are their most current versions? I'm interested in
S2>a) Terminals

BayCom 1.60 (last OFFICIAL version), SP 6.50, The Other Packet, Graphic
Packet 1.61b, TSTHOST, etc... there are plenty of terminals using
BayCom modems.

S2>b) Mailbox (personal or multiuser)

T.O.P, SP 6.50 and Graphic Packet can run a small (very small indeed)
mailbox. Check their manuals.

S2>c) bbs

Well, F6FBB 5.15C easily runs with these little modems + TFPCX 2.10.
I think it's the best solution, unless you want to try TCP/IP. FBB
5.15c supports landline modems.

S2>I've got TFPCX 2.10, but I haven't a clue what I can do with it (mubaycom
S2>uses it)

TFPCX 2.10 is a driver allowing you to run one or more Baycom modems on
LPT and/or COM ports. In addition, you can also run one or more KISS
interfaces, BayCom USCC Cards. For example, you can use a little modem
on COM1, a KISS TNC on COM2, an internal USCC Card (4 or 8 channels),
and run a KISS wire-link at the same time. However, don't expect to run
all this on an old XT computer :-))
Here I use a BacyCom USS card (plugged in my 386, 4 radio ports), a
KISS wire-link to another computer, and a BayCom modem on COM1. It
works quite well with G.P. 1.61b !

S2>I'm interested in shareware prgms I can ftp off the net, to see what suits
S2>me best before putting any money down (if I had cash from the start, I
S2>wouldn't have homebrewed the packet modem!).

Hmm, ftp sites is another problem. I only have Email, so I won't be
able to help you. If there are any Fido users around here, send a
file-request to 2:323/9. This BBS periodically receives new versions of
the above mentionned programs (all sharewares of course !). Then you'll
be able to send them on any ftp sites.

S2>Feedback desired. Please post or email.
S2>Thank you.

I hope this mail helped. Just ask if you need more info.

73s.

552. 1995 Special Olympics World Games

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-03 13:23:48 UTC
From: battles@ibm.net
Message-ID: <3gtap4$11l8@news-s01.ca.us.ibm.net>
Source record: 45033

FACT SHEET: 1995 Special Olympics World Games
June 28-July 9, 1995
New Haven, Connecticut

Greetings to all radio amateurs!

The US Congress authorized a large appropriation to help fund the 1995 Special Olympics World Games, the biggest sporting event in the world in 1995, and the biggest event ever held in southern New England! More than 7000 Special Athletes from 140 countries will participate in 25 events at the Yale Bowl and elsewhere, and organizers expect more than 2000 coaches, 15,000 family and friends, 1500 media representatives, 700,000 spectators, and many celebrities, honored guests, heads of state and other VIPs to be on hand (such as Gov Rowland and probably President Clinton and Vice President Gore). There will also be many hours of national network TV coverage and enormous amounts of other media publicity.

All Amateur Radio operators are invited to volunteer their time and effort to take part in communication support for this enormous public service activity.

I have agreed to serve as volunteer Amateur Radio Liaison to the 1995 Special Olympics World Games and we are planning several Amateur Radio activities. Clubs and individual amateurs are asked to assist by getting involved NOW, as the Games are drawing near and coordination is well underway.

All ARRL Connecticut Section cabinet members have been briefed on the event plans and are graciously helping me with coordination.

Hams will operate a special-event station, W1SO (call sign courtesy of Bill Carpenter, W1SO, of Bristol), which is being managed by Neil Salowitz, WA1CBW, of Amston. Kenwood, AEA and other major ham radio manufacturers are acting as corporate sponsors and donating the use of a large amount of equipment. If you or your club would like to participate, please call Neil right away at 203-228-4922.

We have been asked to participate with each of the Host Communities throughout the state that are each hosting Special Athletes' delegations from a particular country. Amateurs are needed to set up HF stations for a demonstration/presentation at schools in most Connecticut towns to explore the educational aspects of meeting people from other countries and looking at their cultures, geography, etc. We need a Manager to coordinate this project and volunteers (clubs or individuals) to set up stations at local schools for a day. Please contact me if you can help.

We are also going to establish message centers in the Olympic Town Complex to let the Special Athletes and delegations originate NTS radiograms to send to their homes, in the US and overseas. The NTS Project Manager is Jim Ritterbusch, KD1YV, or his daughter Michelle, N1PNT, at 203-790-7041. All hams interested in traffic handling should contact Jim or Michelle immediately.

Connecticut ARES members will be requested to stand by for general communication support, and the CT ARES Search-and-Report Team will be activated on standby for the Cessna Fly-In at Bradley Airport in Windsor Locks on June 30, where several hundred private aircraft will sortie to bring in Special Athletes and VIPs. Contact ARRL CT Section Emergency Coordinator Clark Magness, NI1U, at 203-457-1892, to assist in ARES operations.

Hams will also support the bicycle races and foot races; to assist, please contact Dick Phelps, K1SW, at 203-875-0151, or Don Izzo, N1HAX, at 203-466-0435.

The Special Olympics Committee has also requested hams to provide ATV coverage for live video of certain outdoor events, such as the road races and sailing events. Some of this will be done by stationing hams on boats and military helicopters. ATVers who want to help should call me.

All hams who assist must be officially registered in advance so that they may be placed on the volunteer rosters and issued the proper clearance, access credentials, passes, etc. Don't wait until June--that will be TOO LATE. McDonald's, as a corporate sponsor, will provide food for all 45,000 volunteers, although out-of-state volunteers must arrange their own lodging.

All clubs are asked to distribute this information immediately to their members, in meetings, on the air and via newsletters. If you have questions, contact me.

This will be the largest public service event most of us will ever see in southern New England and it's an opportunity to exemplify the powerful capabilities that make the Amateur Radio service a vital national and international resource. Thank you for your assistance!

Can anyone recommend any good books on modulation/demodulation of digital modes (ie. packet, rtty, amtor, wefax, sstv) ? With a slant on computer interfacing or interpreting (software) would be ideal, but (I expect) too much to ask for. Other radio signal/software interpretation is also interesting to me. Such as the tuning algorithms/indicators on TNC's like the MFJ or in various ham software I've looked at. What's up with that??? Any guidance appreciated. THX for anything. 88

559. KAM Plus Upgrade 7.1

Newsgroup: rec.radio.amateur.digital.misc

Spoke with Kantronics today re: the new upgrade. Here's what I discovered:

1) Version 7.1 has been out since 10/94.
2) Upgrade cost $34.95, less shpg/hdlng
3) Upgrades come out about every 6 mos. Wouldn't commit to the date of the next release. Why waste money if a new upgrade is coming out around Dayton timeframe.?
4) Me: "What do you get for your money? New TOR function, that's it?"
Response: "Yep!"
"Hold it", I say, "I understand there is a change in the host mode protocol."
Response: "Oh, yea, a minor change."
5) My conclusion: Don't waste your money at this time.
6) YMMV

Announcement and First Call For Papers

ARRL DIGITAL COMMUNICATIONS CONFERENCE
September 8-10
Arlington, Texas, U.S.A.

Mark your calendar and start making plans to attend the year's premier event in digital communications. The 14th Annual ARRL Digital Communications Conference will be held September 8-10, 1995, in Arlington, Texas -- just minutes from the Dallas/Ft. Worth Airport. Co-hosts for the Conference are TAPR and the Texas Packet Radio Society.

The ARRL Digital Communications Conference is an international forum for radio amateurs and experts in digital communications, networking, and related technologies to meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications.

Anyone interested in digital communications is invited to submit a paper for publication in the Conference Proceedings. Presentation at the Conference is not required for publication. Papers are due by July 21, 1995, and should be submitted to Maty Weinberg, ARRL, 225 Main St., Newington, CT 06111 U.S.A. or via Internet at lweinberg@arrl.org. Please contact Maty for detailed format requirements.

The hotel/conference center is extremely well suited and well sited for this event. They regularly host other communications-related events and staff members are very familiar with the sight of satellite dishes springing up on the lawn! They and we are looking forward to a tremendous conference. We hope YOU can be part of it!

For more information on the Conference, registration, and hotel reservations please contact TAPR at the address below:

: describing various faster packet bits, including the ARRL 2Mbit link. I
: believe the speed limit on that rig was the FSK chip.

Actually the limit was the modulation bandwidth of the 10 GHz doppler
radar transceivers when using bias-push tuning. It's really a pretty
crude method but it's simiple and does work until the information
bandwidth gets too large. There's signifant AM component to the
modulation and higher rates/deviations the distortion eventually gets to
be intolerable. If you are interested in the details, I show a plot of
amplitude and frequency as a function of bias voltage for a similar
source in my 1988 Ham Radio Magazine design series.

The receivers were able to copy 10 Mbps data (sourced from a microwave
signal generator) even though the FSK chip is only rated to 2 Mbps, I
ran it at reduced output swing and it still worked much faster.

The other practical speed limit was digital hardware to handle the
resulting data stream. I'm not convinced that Ethernet cards can't be
made to work but neither is that my area of experience. It looks to me
like the Ottawa PI2 card loaded with 20MHz parts or a Gracilis card
should be able to run things past 500 kbps just fine.

Here is some info I got off of Fidonet a while back. I sure would like to see
a program like PKTMON for ACARS.

Msg#:50835 *ECHOS/SHORTWAVE*
05/31/94 22:06:28
From: FRED HATFIELD
To: ALL ACARS FANS...
Subj: HERE'S THE ACARS SPECS
Just re-discovered the stuff that Ed Flynn sent me some time ago:

ACARS parameters and protocol:

6A9 Emission
40 character line to aircraft.
220 character limit to message.

Carrier = 2400 HZ. Modulation = MSK (Minimum Shift Keying).
Baud rate = 2400 bps, synchronous, odd parity.

Format: Each packet of data contains -

Pre-key = 16 characters of binary 1, so that receiver AGC can stablize.
Bit sync = the characters + and * are transmitted.
Character sync = two SYN (hex number 16H) characters are transmitted.
Start of heading = one SOH (hex number 01H) is transmitted.
Mode character = the number 2 is transmitted next.

Then the addresses and text follow. This is all encoded with

Suffix = ETB (hex number 17H) if more data blocks will follow, or
ETX (hex number 03H) if no more data blocks will follow.

Hope this helps someone to come up with a software capture program. I have a source listing in assembler that was used on a TRS80 model 4 that was supposedly used to copy transmissions successfuly. I'm going to try to recreate it and if it works, I'll see if I can re-work it into PC assembly code.

To get Cut Off Lambda multiply internal radius by

TM modes 01 2.613
11 1.64
21 1.224

TE modes 01 1.64
11 3.412
21 2.057

Probably launching TE11 converting to TM01 with screw.
It would be better with a larger Dia 1 1/4, 1 1/2
at 1 1/2 inch you could use TE 01 and get attenuation per
meter down to 0.0015dB/m
from 0.005dB/m for TE11
and 0.013dB/m for TM01 at 10GHz

only converting to TE11 at the antenna.

20% bandwidth sounds normal but circular guides
mode jump easy, hence rectangular ones although

more expensive to make are so popular.

Victor Roetman, N8UFW
vroetman@beta.tricity.wsu.edu
>>>>>

In answer to your question -- it is very common practice to hook , for
example, the
transmit audio from a KAM or AEA TNC to an HF radio mic or accessary
connector input ...

In a well-designed xcvr, i.e. one with acceptable levels of audio
distortion, hum, etc in the transmit audio circuits, the data heard over
the air from an AFSK xcvr is
indistinguishable in quality from " pure " FSK - .. A simple way to look
at this over the HF bands is to note the many many amateur HF transceivers
which generate CW through this method -- They have an internal " twin-tee"
or other type of audio oscillator at 1000 Hz and this audio is routed to
the balanced modulator of the rig ...

The area to watch for here is the amplitude of the audio tones from your
TNC and where the tones are connected to the transceiver .. in many cases,
going to a microphone input can produce a reduced signal/noise ratio in
terms of the extremely low-level audio signal needed at the mic input
connector in order to produce, say, 50% of the transceiver's rated power
output ...

I have three rigs that use AFSK as follows :

TNC set for 1 volt RMS output of Transmit audio and can be connected to
either:
a: Harris RF301A military HF radio via the Remote Control connector
on the
back panel -- adjustment of actual xmit power out is done using
the "mic level adjust control on the front panel of the rig.
b: same TNC hooked to a spare pin on the mic connector of a Yaesu
FT70/G
manpack radio - audio goes into the transmit audio stage

AFTER the
first microphone amplifier stage -- level is adjusted internally
using a bourns 10-turn trim pot and a .01 uf coupling capacitor

c: same TNC hooked to the remote control connector of a SUNAIR model

GSB900DX military HF transceiver .. this radio has a seperate
plug-in card
with line-in and line-out level controls ... so I adjust the
line-input control
to provide 50% of rated power while using continuous mark tone
in the RTTY mode ...

hope this helps ...

Suggest trying MacNet and IM/Mac Mailer available for ftp at ftp.ucsd.edu.

Also AEA has a good program for the Mac which I helped beta test four years ago or so. It was called Macket then. Not sure what AEA calls it, but it is a nice packet terminal for PK-232.

You probably want to setup TERM for Linux, running thru the TNC rather
than a modem. At least that's the approach I'm working on.

573. 9600 mod for kwd TR-3500

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-04 06:58:38 UTC
From: Kim Mansfield <kmansfield@delphi.com>
Message-ID: <Z2-ZTke.kmansfield@delphi.com>

Hi,

Does anyone have 9600 baud mods for a Kenwood TR-3500 HT?
Maybe this can't be done. I have had the radio for some time
and
don't use it.

Thanks in Advance

>Hello there,
>I am not sure if this is the correct place for the following question but I am
>having a lot of trouble finding info on ACARS transmitted on 131.725Mhz. I

>think ACARS stands for Aircraft Communications Addressing and Reporting System.
>My question is what form does the data transmitted on this frequency take??

Paraphrasing from "Understanding ACARS" by Ed Flynn (Universal Radio Research, 6830 Americana Way, Reynoldsburg, OH 43068)
and the manual for my M-400 decoder (which, connected to a scanner, I use to receiv ACARS) ....

ACARS could be linened to a dorm of "commercial" (ham radio) packet. Mode is AM ... data bursts ...maximum of 220 charachers per message ... 2400 Baud ... the system has some faily sophosticated errordetecting capabilities with positive control over message integrity, on three levels: bit, character and message.

131.725 is NOT a familiar I am familiar with for ACARS. The primary frequency used - in North America, anyway - is 131.55, with 130.025 secondary in busy areas and 129.125 MHz tertiary. 131,725 is apparently used in Europe, however.

Hope this helps, however little.

David R. Alpert, KB2LUM

>

Also, anything written for a PK-87 >should< work in a PK-88. The
differences are:

1) PK-87 has 16k of ram - PK-88 has 32k of ram
2) Early PK-87's had 2.4576 MHz clock, late PK-87's and PK-88's have
4.9152 MHz clock.

I too am not aware of any 'aftermarket' firmware for the PK-232/MBX.

Hi Victor ...

I ran a very active HF port on FSK for about three months and then
switched to AFSK. Don't care what they say, I did it and I saw _NO_
difference in performance. I was using a KAM and a Kenwood 450 (which
is a VERY digital friendly radio).

> they use?

Using FM rigs is inefficient. You're modulating a modulation when you feed modem tones into a FM transmitter. The FCC allows an occupied bandwidth of 20 kHz on 2 meters. If you use it all, using AFSK over FM, the maximum baud you can get with 3 kHz deviation is 6 kb. Using a more efficient scheme, the Heatherington MSK RF modem, which uses 1.2 Hz per Baud, you can fit 16.66 kb in the same bandwidth. The G3RUH type 9600 baud modems use a direct FSK scheme, IE they are using the FM rig as an FSK transmitter, not as an FM transmitter. With 3 kHz shift, the main sidebands of that occupy 13.2 kHz, and with the waveshaping used, the secondary sidebands just about fit in the 20 kHz channel. With many rigs, there is some spill outside the allowed 20 kHz channel.

>If I'm not mistaken, the phone company allows about 5khz bandwidth on their
> voice lines, which, if your lucky you can get 28.8kbps through. Could this
>be done over the radio?

Now baud and bps are two different things. Baud is the maximum symbol rate, and it's fairly hard limited by the bandwidth available. However, one baud can represent more than one bit, an example is QPSK. By loading more than one bit per baud, you can achieve higher data rates. However, the Shannon limits impose a cost for doing so. You have to trade off SNR for bps when using these high bps per baud encodings. Phone lines typically have a high and stable SNR and a fixed phase response for a given connection. Radio circuits often do not.

If you can establish a duplex radio connection with the same sort of SNR and phase stability offered by a phone line, you can use 28.8 kbps modems on it after a training sequence. But this is very different from the half duplex shared channel usage typical of amateur radio packet. The telco-like link does connection signalling out of band, and guarantees that only the desired signal will be present for the duration of the connection. So the modems can do one training sequence and proceed with their transfer. On typical shared half duplex radio channels, that can't be done. Connection

signalling is in band, so each station must be able to decode the headers of packets from *every* other station using the channel *without* training and setup.

That's the killer. In amateur radio, there are too many different brands and kinds of radio, each with it's own particular phase and frequency response, operating over multiple paths of varying SNR and multipath. No one training sequence will work for all of them at the same time, and unless you can recognize that a signal from a particular station is addressed to you, you can't start a training sequence with it to compensate for those variables. With the burst nature of packet, a training sequence per packet would be too time consuming in any event.

So, given the realities of the kinds of operations we do, the very high bit per baud loadings used by advanced telco modems won't work in our service.

>processing TNC's use an FSK connection into the HF radio?

With a properly adjusted SSB transmitter, and pure tones, AFSK over SSB is indistinguishable from FSK. Of course those two qualifiers can be killers in the real world. FSK consists of two discrete RF frequencies that are shifted between to represent symbols (baud). Feeding two audio tones of the right separation alternately into the input of a SSB transmitter will produce the same two RF frequencies at the output. The SSB transmitter can be thought of as simply a hetrodyne mixer performing a frequency translation.

The catch comes when the AF tones or the SSB transmitter aren't perfect. Then other products will appear at the output along with the desired frequencies. With good equipment, properly operated, this isn't a severe problem on the noisy HF bands. The products are typically suppressed sufficiently not to cause problems for others.

It's very important to operate conservatively. Don't push for maximum smoke. Use care to insure that your operation is clean. It doesn't take a lot of power to operate digital successfully on HF. That's good because the duty cycle of SSB rigs means you can't output a lot of clean power from them at the 100% duty cycle of FSK operation. SSB typically has a 20% duty cycle because of the nature of the speech waveform. For digital data, operating at 20% of SSB PEP ratings is a good rule of thumb. Thus a 100 watt SSB transmitter should be operated with an output power of 20 watts in digital service. Some rigs will let you push harder, but you should examine your transmitted waveform carefully, and watch heatsink temperatures carefully, if you try this.

FSK will not be prone to distortion broadening the output signal.
In my experience, the great advantage is that in many rigs permitting
FSK, the i.f. is also offset on "rtty" so that narrow cw filters can
be used in receiving, not generally possible in rigs without specific
RTTY modes. GL and 73 Gerry K8EF@W8CQK.OH.USA.NA

Does a bear.... ah, sure it'll work. A 4-wire to 2-wire hybrid would
be nice, but the Tx audio won't harm the Rx if you just parallel them.

Source record: 44963

Hello to all

I am currently setting up a JNOS BBS with all the featured installed
However I have serious problem configuring a modem port so someone
could login a 14,400 bauds on the phoneline

I tried a slip port
The modem answered but the callers never went to the login prompt
The connection always stayed inside the modem but didn't connect to the
PC
Then I tried a PPP port
By adding the PAP command the callers were able to go to the login
screen but the login was always refused
I added the authorized callers in my autoexec.nos with their names and
password but it didn't change anything

Now what should I do
Go back to slip and dug a little deeper ?
Or try again to setup a PPP ?

any ideas someone ?

Quoting jlarson from a message in rec.radio.amateur.digital.misc

=> Has anyone every experimented with hooking several TNC's together
=>(audio transmit and receive lines parallel) all to the same pair of
=>wires and seeing if you can communicate? I think in theory it would
=>work, but was wondering if anyone had actually tried it.

In theory, I would think that it would work, although I haven't tried it
either...

=> I am needing to communicate over a 2 mile range and there are some
=>dedicated phone wires available to tap into. A total of 4 TNC's would
=>be hooked up to the same pair of wires.

Now here it would concern me. We are talking about DC voltages in the
millivolt range, and at best, no more than something along the lines of 5
volts. Over two miles, I would think that you would see quite a bit of loss
between the TNCs. You probably could try and build some sort of an amp to
put inline with it?

=> Thanks in advance for any input.

You're welcome!

591. HOAX against AmSoft

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-05 21:49:11 UTC
From: amsoft@epix.net
Message-ID: <3h3h4n$sev@grape.epix.net>
Source record: 44973
Cross-posted to: rec.radio.amateur.policy,rec.radio.amateur.antenna,rec.radio.amateur.homebrew,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.amateur.space

I question if the person called bob@texas.net really exists or if it was just a HOAX and a campaign by a spineless internet hacker to damage the AmSoft reputation.

I submit the following information and request that you as an individual test the information for yourself.

On 2/5/95 I did a FINGER on bob@texas.net and received the following information:

>--- Host: texas.net User: bob@texas.net ---
>Login name: bob
>In real life: Robert J. Scott
>Directory: /home/b/bob
>Shell: /bin/menu
>Last login Fri Jan 20 20:39 on ttyrc from sa-pm1.texas.net
>No unread mail
>No Plan.

Take a look at the LAST LOGIN DATE!
(Last login Fri Jan 20 20:39 on ttyrc from sa-pm1.texas.net)
So how is it that bob@texas.net has managed to post so many messages in the rec.radio.amateur.* usenets as bob@texas.net since Jan 20 and texas.net's finger has no record of it?

Take a look how he connected thru TEXAS.NET ON JAN. 20, 95
(on ttyrc from sa-pm1.texas.net)
Is sa-pm1 a code for SPAM?

It looks like the wool has been pulled over our eyes on this story.
Even the FCC records for WY7O don't correspond to the Texas area.
Whoever you are pretending to be WY70 we are onto your HOAX.

FYI, AmSoft has not posted any reference to it's products since January 27th and will not post reference to AmSoft products in the future except for the rec.radio.swap usenet, and in the amsoft signature when responding to usenet messages.

To all readers of the rec.radio.amateur.* usenets AmSoft posts this public apology to anyone that became annoyed by any aspect of the continuing posts by or about AmSoft and its product.

I request that nobody post a response to this article unless they intend for their message to appear in all 7 rec.radio.amateur.* usenets (read header of this message first)

Sincerely,
Pete, KC3TL

Memorial Dedication in Washington, D.C., this summer?
If not, any suggestions for e-mail addresses?

The dedication will be July 27, 1995, on the Mall. The
Memorial is now under construction next to the Lincoln
Memorial. All $17,000,000 needed has been raised, and
it is time to remember the Forgotten War.

Mike,
As I posted to Bob Scott can we please let this go. The bandwidth
wasted on this debate could have posted the entire catalogs from
HRO or AES. Pete said he was just going to post in forsale from
now that should be good enough. 73 de Jerry

Boy Pete, you really are a newbie without a clue as to how the net
works or how networks in general function, aren't you? Your whole
posting had me laughing. I hope your programming skills are better than
your understanding of networks, for your company's sake.

MD

Saw your question on hard-wiring TNC to a common audio twisted pair --

yes, this is done all the time in the data world >> 10baseT << is
X.25 packet coupled to unshielded, twisted pair (also known as UTP) ..

Using amateur packet radio units the way you plan may mean (to you) that
use of a common server is not the plan ?? -- From your description, you
plan to just do the equivalent to amateur packet radio but on land-lines
?? If so, coupling to the phone line thru standard TELCO methods mauy be
in order - this would be to use a transformer hybrid (like what hams do
with hybrid phone patches) .

The Hybrid would allow full-duplex operation, a way to decouple the
transmit and
receive ports of your TNC so the ports do not actually see each other..
also your tnc may work better if both the tx and recive ports on the tnc
are set for 600 Ohm
impedance levels. The hybrid xfmr will also de-couple any DC voltage that
may be seen on the line otherwise. The hybrid will also preserve
line-balance in order to keep the system from picking up noise and
cross-talk ..

hope this helps -- a neat benefit of your method, would also allow a
near-end tnc
to connect to a far-end tnc by using Ka-Node protocol if you are using
Kantronic
TNC's . This would overcome the overall line losses from causing a problem
by using the inermediate units to digipeat the traffic and use local
acknowledgements ...

good luck!!

597. Dan's Atari Lynxlist! (trade, sell & buy games & accessories)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-06 03:42:08 UTC
From: SA073@getty.onu.edu
Message-ID: <SA073.284.2F359A90@getty.onu.edu>
Source record: 44981

Games are listed in all capital letters, to distinguish them more easily from names and addresses. There are 3 simple things to remember when listing your games. $ means for sale, = means for trade, and ! means wanted. For example, if I wanted to sell Joust, I would write it like this in my list: $JOUST$, and if I wanted to trade joust, it would be =JOUST=, but if I wanted the game, and did not have it, I would write it at the end of my list, !JOUST!. In fact, please put all of the games you have for sale, for trade, and the games you want at the end of your list. It will make it easier for everyone to find, and also for me to change as games are sold, traded, and bought. Also, if you happen to have a game you would either trade or sell, instead of writing it twice, just write it once and put both marks around it, with your preference closer to the name of the game. For instance, if you wanted to sell, but would also trade, you would write it as =$JOUST$=, and if you would rather trade, but might sell, you would write it as $=JOUST=$. I hope this simplifies the list a little bit.
In each case, the games are located below the name and address of the person who has or wants them. Keep in mind that a person may sell a game that is for trade, if you offer enough. Or they may trade for a game other than the one they wanted, if you can work out a deal with them. Feel free to include any games you own or other info in this list.

There are now 61 Atari Lynx owners in this list. If you are one of the
first few people without a name, or with part of your name missing, please
take the time to e-mail me so that I can fill in the missing information.
Also, if you want to include any other information, feel free to do so.
I have been thinking of adding something to the end of this list. Perhaps
some type of game review would be useful? I have only played about 10 of
the almost 80 games available for the Lynx. Although I think that Nick's
game ratings are helpful, they do not give a good overview of the reviewed
games. I was thinking about adding some type of overview at the end of the
Lynxlist. I'm not sure what to call it, but that's what it would be about

anyway. Some of you could do quite a few reviews, it looks like. So, do any of you like this idea? The review could focus on 1 or 2 games. You would have your name attached at the bottom of your review, of course. I think I would put Nick's game rating of the game at the top, and then follow that with the review(s) of the game(s). Reviews should be about a paragraph, and tell specifically what you liked or did not like about the game, it's replay value, sound, etc. If enough people write back and think this would be a good idea, I'll incorporate it into the posting of this list.
Hope you enjoyed everything, and I hope you find this list useful. If you sell a game or anything, let me know so I can update the list.

Dan Woodard

598. STS63 packet callsign

Source record: 44984

Noel Montales (Noel.Montales%f10.n1231.z87@fluxline.mi.org) wrote:

: I've been curious about this for some time. Given the bandwidth/deviation
: restrictions on standard 2meter and 440 FM, what really is the highest data
: bit rate than anybody has been able to sustain? What type of modulation do
: they use?

: If I'm not mistaken, the phone company allows about 5khz bandwidth on their
: voice lines, which, if your lucky you can get 28.8kbps through. Could this
: be
: done over the radio?

Certainly--every now and then you get someone who wants to patent his
new data modulation scheme--he gets a fantastic throughput from one
end of his workbench to the other. The snag is that people want high
throughput even though signals are weak, as the market for radio
modems drops off dramatically as the cost and antenna complexity goes
up.

From: jkbe@lena
Message-ID: <D3L5DJ.BD5@nntpa.cb.att.com>
Source record: 44989

I have a friend that is having trouble setting up BPQ and FBB. He has several TNC's on his BBS and he would like to limit the 1200 baud connects to one per frequency while allowing 3-4 connects on the higher speed user TNC's and forwarding ports. I believe he has five com ports and five TNC's on the BBS.

I'd appreciate if a few BBS operators with similar stations would send me their PORTS.SYS files as examples.

Thanks,
John

In article <3gitep$d2d@miranda.gmrc.gecm.com> g6jpg@gec-mrc.co.uk (John Gilliver) writes:

>I don't know about the TCP/IP standard(s), but the main difference between X25
>and AX25 is that AX25 packets contain the addresses of both sender and receiver,
>whereas X25 only contains one of them (I'm not sure which) □. (Please excuse
>odd characters - I don't know this editor properly.) Also, the AX25 packet frame
>can include up to eight (I think) `via' stations, for digipeating; I don't know
>if the X25 standard includes this.

I've said this before and I'll say it again: AX.25 and X.25 have four things in common: "X", ".", "2" and "5". Not a whole lot more. X.25 defines two layers, data link (LAP-B) which is point-to-point and network/packet (PLP) which has connection-oriented addressing -- the virtual circuit number implies source and destination which are set up before data is passed. X.25 is an old ITU standard. What AX.25 shares with it is the use of HDLC (even older ISO standard) framing. But that's what practically all data link protocols nowadays use, because the chips are plentiful. AX.25 and LAP-B are very different.

>Incidentally, can anyone point me at actual CHIPS that implement X25? I have an
>application for work, using quite high-speed data, and I'd like to know if X25
>is a viable possibility - or AX25, for that matter.

Hardly anybody tries to do X.25 on a chip; L3 is best left to a processor. But the HDLC hardware-oriented aspects are done on many chips, of which the 8530 is a common family.

>Whoever you are pretending to be WY70 we are onto your HOAX.

OK Pete, you got me. I really don't exist. Or do I??!? Actually, when
I discovered how to travel through the space-time continuum using my
IC-765 and a Henry 5K Ultra to excite a subethereal space modulator, the
FCC gave me an extra class ticket out of sheer awe. Of course, since I am
now omnipresent in multiple temporal dimensions, the address from which I
operate isn't that important. yeah, that's it. Or maybe it's just that
the texas.net host had the wrong date/time. And of course, telnet might
be a valid explanation of how my whereabouts don't match my host location...
Tricky stuff! You are now deserving of the title "Junior Net Detective,"
provided, of course, you send in the correct number of boxtops...

You *were* joking, weren't you???!?

>
>FYI, AmSoft has not posted any reference to it's products since January
>27th and will not post reference to AmSoft products in the future except
>for the rec.radio.swap usenet, and in the amsoft signature when

All joking aside, thanks for the consideration! I read .swap regularly and
don't especially mind seeing any ham radio related ads therein. That's
what the swap group is all about, no?

Well, I must leave to the other dimension now. 73, or as we say in the future, 72.9999999997. [Pentiums will be the standard soon]

>

I, too, am part of everybody else, and it DOES offend me. Advertising is considered de rigeur on most groups, and if you don't like it, start your own group. There are lots of ways to use the Internet commercially without injecting unwanted ads in Usenet groups that don't want them.

><junk elided>
>
>|> Everybody hates TV commercials. If you were to add up all the time
>|> commercials waste in ones lifetime it would be a substantial sum.
>
>I don't watch the commercials on TV unless I *want* to watch them.

>I look away from billboards that are not of interest.
>I throw away junk mail while walking from the car to the door.
>There are entire SECTIONS of the newspaper that hit the recycle
>pile as soon as they arrive.
>
I don't have to pay for commercials on TV that I don't want to watch.
I don't have to pay to read bulletins on packet radio that don't interest me.
I don't have to pay extra for advertising pages in magazines that don't interest me.
I don't have to pay for billboards I'm not interested in.
I don't have to pay for junk mail I throw in the fireplace.
I don't have to pay extra for parts of the paper I don't read.
I DO have to pay for Usenet articles that aren't of interest to me.
Unwanted and unsolicited advertising is the equivalent of junk faxes, and ought not be tolerated.

>Is this a big deal? No. It's trivial.
>
You're wrong. It is a matter of principle, and it is NOT trivial.

>So folks please stop whining about how "the net" "should not
>carry any advertising". "the net" is just as much a commercial
>enterprise as any magazine, newspaper, etc.
>
The Internet is indeed a commercial enterprise, and I don't think anyone here is offended by the idea that the Internet should carry commercial traffic, or allow businesses to send WANTED email to clients. Usenet, however, is not the Internet, and the posting of inappropriate commercial advertising is neither necessary, proper, or desirable.

What should determine the subject matter of a Usenet newsgroup is the charter description voted on by Usenetters when the group was formed or revised. If businesses want to create a Web page describing their service or product, great! If they want to start a mailing list for potential customers to let them know what's available, that's fine, too. But they have NO business intruding commercial activity into what have been relatively commercial free newsgroups.

>Get used to it.
>
Nope. I won't. If necessary we'll organize moderated groups to keep out those who insist on advertising where they're not wanted.

>Get mosaic running and have a peek around the real world ...
>
Fine. Just keep ads out of newsgroups that aren't interested in paying for YOUR ads. Let the readers choose whether or not they want to read ads by putting them only in groups where the readers ask for them.

From: queisser@CSOS.ORST.EDU
Message-ID: <3h8l2t$3jb@jadzia.PEAK.ORG>
Source record: 44899

I've got a couple basic questions about Packet Radio and TCP/IP. I understand how networks work in general and I'd like to know how they compare to radio as a carrier. I don't know much about amateur radio but I'm enamoured with the idea of having a wireless connection without having to buy into the cellular phone culture. Here's what I'd like to know:

- How does the medium get shared between clients. Is there a collision/ retry mechanism as in Ethernet? If everyone sent at the same time wouldn't I get tons of packets garbled together?

- I've heard of a "Packet Network". Is this comparable to the Internet in that I would have to get the equivalent of an account? If I wanted to send a message to someone across the country would I have to have direct radio contact with him or her or is there some kind of store and forward mechanism?

Thanks for any info
Andrew Queisser

Stephen Gare (sgare@ids.net) wrote:
: Has any one used the Hostmaster for pc for the Kantronics KAM? How is it?

Yes, I bought it and used it for about a week. My recommendation is "DON'T BUY IT" If you need a good Kam+ tnc host software, check out xpkam by Gary Johnson. You can get the program by anonymous ftp to ftp.indirect.com

hostmaster costs about $70 (which I still regret spending on it) and is no where near the xpkam. You can make up your mind if you want register for xpkam after you try it out. Think you have a month or 100 times to try out the software before it expires.

Hope this helps,

If you want the host mode , you can get the later firmware from MFJ or (without mailbox) from TAPR. TAPR has the eprom images available by ftp from ftp.tapr.org . Get software_lib/tnc/eproms.exe, which is a self-extracting file with the 1.1.8a firmware, state machine and kiss eprom images. The file hostmode.exe has information on the host mode, but to my knowledge, nobody has written any programs which really make use of its capabilities. Information is also available on ftp.tapr.org about ordering an eprom with the tnc firmware.

I agree with all of the above wholeheartedly. I don't agree with the statement about QRM. In my personal experience amtor holds up better than pactor under high QRM. I have had a couple g-tor contacts under QRM condx. It held up extremly well, I think that mode has real potential. Too bad it's somewhat proprietary.

Anyway, go for the upgrade!

TCP/IP is generally carried over the radio channel in a AX25 wrapper.
If virtual circuit mode is used, the retry mechanism of AX25 will be
used. If datagram mode is used, then the retry mechanism in TCP is
used. In both cases, the AX25 CSMA mechanism is used. The packet will
not be transmitted while the hardware hears another signal on the channel,
and if there is a collision due to a hidden terminal (one the intended
receiving station can hear but the transmitting station cannot), then
a random seeded backoff mechanism is used to avoid a collision on the
retry. This is pretty much the same as ethernet, except for the hidden
terminal problem.

> contact with him or her or is there some kind of store and forward
> mechanism?

This is the weak area of amateur packet activity. If there is a direct
realtime path (through any number of intermediate routers), then you send
your message using smtp just as you would on a wired network. However, for
distant stations, it's unusual at present to have a direct path. So there
is a system of forwarding BBS stations that will accept your message and
forward it through a series of other BBS stations using non-realtime paths
until the message arrives in direct connection range of the destination
station. There the message may be automatically forwarded to the destination
station or held for pickup by the destination station depending on local
arrangements. You can picture this BBS system as somewhat akin to the
uucp linkages used for parts of the internet's Email functionality.

You need an IP address assigned. There are area coordinators who
will assign your station an IP address. That's all you need for
IP connections. The BBS systems use your amateur call sign
(grouped with geographical routing hints that *look* like internet

names but *aren't*). Since the FCC assigns your call sign, and your routing hints are a function of your geographic location, you don't need an authoritative assignment beyond that. You'll have to manually decide between smtp and BBS delivery mechanisms at the time of message origination. The system typically doesn't yet automate that choice.

633. UltraPak 2.0 via FTP

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-08 15:41:12 UTC
From: Tim@cirrus.demon.co.uk
Message-ID: <792258072snz@cirrus.demon.co.uk>
Source record: 44922

Version 2.0 of UltraPak is now available via FTP from the site:

ftp.demon.co.uk in the directory /pub/ham

The filename is upak20.zip and the file size is around 470 kbytes.

For those who have not yet met UltraPak, it is a Windows 3.1 terminal program for TNC-2 compatible TNC's. It offers full multi-connect support, auto-splitting of the Receive Window, message preparation facilities, user-definable colours, fonts etc., YAPP and ASCII file transfer, disc and printer capture, etc., etc. Full on-line help is included.

For further information contact me at:

upak@cirrus.demon.co.uk

Tim Kearsley. G4WFT @ GB7LWB tim@cirrus.demon.co.uk

or download the file and try it !

Hi,
I'm a new member to this list and am not yet sure of posting parameters. So, please forgive me if this posting violates any of the list's principles.

I work for a small nonprofit, Volunteers in Technical Assistance (VITA), that is trying to bring communications to hard-to-reach rural areas in developing countries that are not currently being serviced by existing traditional communications capabilities and are not likely to be serviced in the long-run. One of the technologies we are using is packet radio. Unfortunately, the demand for the establishment of the packet radio stations greatly exceeds our existing manpower capacity. If there is anyone on this list that is a packet radio specialist and would be interested in helping us in this effort I would appreciate hearing from you. Also, if you have any suggestions about associations or other venues for finding packet radio people interested in overseas assignments that information would also be more than welcome.

Thank you in advance.

635. Is JNOS 1.10h incomplete?? - jnos1.txt [1/1]

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-08 20:54:25 UTC
From: skrol@inter.nl.net
Message-ID: <D3p8qr.1ts@inter.NL.net>
Source record: 44909

Haai there,

When I was trying to get to know the JNOS program better (beleive it or
not but I was reading the manual :-)), I saw some commands which were left out.
In some documentation I saw for example the command : lzw compression.
But when I try it in JNOS it isn't working! Why is that I wonder??
LZW compression seems to be a fine tool to me, but why isn't it compiled in??
I don't have a good compiler for it, so I could do it myself. So does
anybody has a jnos110 version with lzw compression compiled in?? And if
it's possible even with a mbox jumpstart in it?? Please let me know (and
were I can download it).
Thanks in advance!

There are more commands in the docs that aren't in the program, but the LZW
one is the nicest (I guess).

Greetings,
Sjoerd

636. Reverse forwarding with TNOS -> how?? - tnos1.txt [1/1]

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-08 20:56:14 UTC
From: skrol@inter.nl.net
Message-ID: <D3p8tq.1uI@inter.NL.net>
Source record: 44910

Haai there,

I'm playing with TNOS so once and a while and I seem to have a problem
with forwarding with a AX25 BBS. Forwarding to it (and receiving at the
same time) seems to work okee, but when I don't have something to forward
TNOS isn't making a connection for receiving the BBS. Is that normal or
is my forward.bbs file not oke? Ny forward file looks like this :

```
# start of forward.bbs
---
# the BBS to forward to
nl3ldn
# to establish the connection
ax25 39 nl3ldn
# the areas to forward
personal
bulls
---
# end of forward.bbs
```

In JNOS you can force a reverse forward by putting a P behind the BBS
name, but that doen't work here. Can anyone help me with this?
Thanks in advance!

Greetings,
Sjoerd

638. PK88 Host Mode Help, Please?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-08 23:21:21 UTC
From: "Steven V. Christensen" <chrissv@cat.com>
Message-ID: <3hbjlh$6ic@agate.berkeley.edu>
Source record: 44912

Greetings All,

I am in the process of writing a Windows program to talk to my
AEA PK-88 TNC in Host mode. So far it is going very well. I have a photocopied
section of a PK-232 manual which the AEA people sent me, which describes
the host mode operation.

When a program requests a connect status, the connection status
is returned as a single digit. The manual says "See State Tables in Appendix
A for Link State meanings". Could somebody e-mail me what the different
link states are (and their number)? Thanks!

Steven

Do a Fourrier tranform on the waveform which is composed of two tone unrelated harmonically. This gives you the two tone frequencies (use Fourrier software found in any BBS - Try FOURRIER.ZIP). Create a matrix of the two tones (4 sets in each column) which gives you 16 combinations. Thats the DTMF number. The actual tones are listed in any ARRL handbook. You can expand the system, to 36 tones of you want, by adding a further 2 tones in each column (ensure they are also unrelated and within the audio passband).

True, the manual omits some of the commands, unfortunately. Ian Wade's
NOSIntro book is more complete, but based on and earlier version of
NOS. The manual is based on 1.10 and anything new after that
certainly is not there either (look at the readme.now file to see
the new stuff. The cmdshelp1.zip file has some pretty good stuff, as well.

Also, when compiling there is a file called config.h which is used
to turn on or off many of the parameters. Any commands associated
with a parameter which has been undefined in config.h will not be
present. I think the distributed compiled version does not have LZW
compression defined.

645. <ad> GUARANTEED CREDIT REPAIR BY LAW FIRM

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-09 10:47:04 UTC
From: ccapc@cyber.sell.com
Message-ID: <3hcrr8$o71@panix.com>
Source record: 44918

Consumer Credit Advocates, PC
11 Pennsylvania Plaza, Suite 2101
New York, NY 10001
(212) 629-5261 (telephone) (212) 629-4762 (fax)
E-MAIL: ccapc@cyber.sell.com

Our LAW FIRM offers direct guaranteed effective credit restoration services by experienced attorneys. THIS IS NOT A DO-IT-YOURSELF KIT.

What can we do?

We have successfully facilitated the removal of Late Payments, Charge-offs, Foreclosures, Repossessions, Collection Accounts, Loan Defaults, Tax Liens, Judgments and Bankruptcies from our clients' credit reports. WE GUARANTEE THAT YOUR CREDIT CAN BE RESTORED!!!

Who needs our services?

Anyone who has experienced the inconvenience and embarrassment of being turned down for a credit card, a lease or a purchase of an automobile.

Anyone who is unable to buy the house of their dreams due to denial of a mortgage application or who has to pay thousands of dollars more in mortgage interest than someone with good credit.

Anyone who has been turned down for a job or promotion due to derogatory credit items on a credit report.

Anyone in business who has lost a deal because a person or firm wanted to see his/her credit report before doing business.

Anyone who has been unable to establish credit.

THE FOUR GREAT MYTHS OF CREDIT:

Myth #1: It is illegal or immoral to have your credit report cleared.

Fact: It is not illegal nor immoral. In fact, that is what the Fair Credit Reporting Act is all about. The act was enacted by Congress in 1971. One of its purposes as to give consumers the protection of the law and to help guard against

any unwarranted invasion of a consumer's right to privacy.

Myth #2: The information on a credit report cannot be changed.

Fact: Actually, the opposite is true under the Fair Credit Reporting Act. Federal and State laws require that items be removed if they are not 100% accurate or cannot be verified in a timely manner.

Myth #3: It is impossible to get a bankruptcy off a credit report.

Fact: Bankruptcies can come off credit reports like any other derogatory item. The nature of the derogatory item has nothing to do with its removal under the Fair Credit Reporting Act.

Myth #4: Credit Reporting Agencies are empowered with some kind of governmental authority.

Fact: Absolutely Not!! They are simply large corporations whose primary goal is to make a profit like any other business.

If you have ever applied for or received credit, a file exists in one or more of the credit bureaus. These companies collect, store and distribute as much credit information as they can find, retaining negative information on a credit report for 7 to 10 years. This information is evaluated by potential creditors to determine your credit worthiness.

Credit reporting agencies are in business to protect the interests of the creditors. the LAW FIRM's goal is to help and protect the individual consumer from inaccurate credit reporting.

The president of our LAW FIRM has been practicing consumer law since 1984. The staff of our firm has successfully processed, disputed and challenged thousands of client credit reports.

Our legal fee is based o the number of negative items that appear on a client's credit reports, issued b the three national credit bureaus. Our retainer agreement offers a MONEY BACK GUARANTEE stating that if any negative item is not deleted, upgraded or corrected from a client's credit file, it will give the client a full refund for that item or continue to process the client's file at no additional fee until that item is

corrected, upgraded or deleted. THE ONLY THING YOU HAVE TO LOSE IS YOUR BAD CREDIT!!

PLEASE CONTACT THE LAW FIRM AND LEAVE YOUR FULL NAME, MAILING ADDRESS AND TELEPHONE NUMBER SO WE MAY FORWARD FURTHER INFORMATION AND INSTRUCTIONS TO YOU ABOUT OUR SERVICE.

In order to accomodate for the overload, would it be possible to ask
the permission of the authors, and or the people who distribute the
software to post it somewhere more accessible, like at ftp.ucsd.edu? It
would handle more of the overload characteristics, and would probably
give more hams access to it, while freeing up the belownamed person to
continue on with what it is he needs to be doing.
I'm using a hapn-2 card at the present, but will be geiing a tnc very
soon. Hope to get the program installed and running. I have an scc
driver, but can also use the tnc for my os/2 based packet, which I'd like
to try as well. SP 6.50 works pretty well for this task, and the nice
thing about the tnt program is that it's very similar as far as users are
concerned, and I feel that they will be more comfortable with using it
than with a tcp type program. I'll probably be upgrading the tnc here in
a bout three weeks, as a new disk drive and an extra four megs set me
back a little, but I like linux alot for what it's best suited for,
multiuser access. Anything that can be done to make dos users more
accustomed to interfacing with it is definitely a plus in my book. 73

649. The adventures of Papo and TNC (i. e. HELP!!!!)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-09 14:53:56 UTC
From: papo@briscas.gamekeeper.bellcore.com
Message-ID: <3hdaa4$jbb@athos.cc.bellcore.com>
Source record: 44928

Everything started yeserday night which MFJ decided to actually
send me the cable to hook my TNC to my HTX-202 and the TNC to
my Amiga. I hooked up everything and turned everything up. So
my session started liked this: BTW, the HTX-202 was running with
battery power which outputs about 2.5 watts. I think this the meat
of the problem

Papo: reset
TNC: I'm the latest in TNC technology and you're just another techno wennie.
Papo: mycall
TNC: Who the hell are you...
Papo: mycall n2zxe
TNC: oh, so you are my next victim.. cool
Papo: mheard
TNC: I have not heard any stupid station out there.

So I decided to started looking around for stations until I heard the
typical packet whining at 145.050

Papo: monitor on
TNC: uh? This is just plain garbagio.
Papo: mheard
TNC: oh yeah.. BTW W2EUA-4 was here.
Papo: connect W2EUA-4

and the TNC huffed and puffed and huffed and puffed

TNC: are you out of your mind, you have been DISCONNECTED.
...

And then data started to appear, somebody else was ussing the W2EUA-4.
So I tried one more time and nothing. More data came out, I'm able to
actually read what was going on but I am not able to connect. Then I
realize that I was splitting i/o and that I was sending a subaudible tone.
Hmmm I tried one more time, but this time sending it simplex w/o the tone. The
node is from a BBS about 45 minutes drive from home, approx 30 miles due to
traffic.

Papo: connect W2EUA-4

and the TNC huffed and puffed and huffed and puffed.

TNC: Heh.. heh.. heh.. this thing is not connecting anywhere dude, try
the Love Connection next time, you have been DISCONNECTED.

rats and bugs! I was starting to get pissed when suddently I got the Book
of Wisdom (TFM).

TFM: If you are having problems connecting to the other side of the moon,
try TXDELAY 64.

Papo: TXDELAY 64
TNC: Cool! Now in slow motion!

Papo: connect w2eua-4

and the TNC huffed and puffed and huffed and puffed

TNC: blargh.. I'm tired.. you've been .. you know.. DISCONNECTED.

Ok guys.. I already fried the RAM expansion of the Amiga, I'm still trying
to connect to this site. If I'm not missing something, then I'll buy the
regulated power supply to see if 5 watts does the trick. I know
that I have a better reach with 5 watts because I've use it from my mobile
and I can be heard where otherwise I've not been able to do so.

or else.. am I missing something???

650. UltraPak 2.0 problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-09 16:01:00 UTC
From: dominick@utkvx.utk.edu
Message-ID: <9FEB199511014753@utkvx.utk.edu>
Source record: 44930

I noticed a day or two ago here that someone posted an article telling where to get the file UPAK20.ZIP. I received the file fine and followed the instructions to set it up. My TNC is on COM 3, which the program supports, but the program NEVER recognizes it. I am absolutely positive that I have the program set up to run on COM 3/1200 baud/8N1. I can run any other Windows communications program, like Terminal, and it will recognize my TNC on COM 3 just fine. Also, the present DOS-based packet program I am presently running has no problem with COM 3. What do you think the problem(s) could be?

Also, what are some other good Windows packet programs that I might want to look into? UltraPak looks pretty nice, but I sure wish I could get it to work!

Thanks and 73's...

Marshall - AA4VG - Knoxville, TN

Hal Communications Corp. in Urbana, Illinois (217-367-7373) use
this in their latest data modem w/DSP for Clover II. I don't know
how open they are about what they have accomplished, but I would
call them and see. I think the card they sell and the mode Clover II
is probably one of the biggest sleepers in data radio area of our
hobby (hobby?). I wish I had the data bug so I could buy one of these
Clover II cards (it does more than Clover II). I have their earlier
card, which does Amtor,RTTY, and CW (very well I might add), but I
never really got the bug. I Just hope that enough people patronize
Hal so that they are still there when I do. Nope, I don't work for
them....barely even know them, but I think they do some nice stuff for
Ham Radio at the lowest price that they can possible manage for Hams.
They do a lot of commercial stuff I guess.

Jim,
I've been running JNOS version 1.10(x15 through g) on my system
for
over 9 months now and have nothing but praise for the software. Well OK,
a few
gripes but most have been ironed out. I run it in a DOS window under
Windows
3.1 on a 486DX2-66 with 8 Meg of memory. I had a friend compile it to
run in
native 386 code to speed it up and included call server CD-ROM support as
well.
The docs for any flavor of TCP/IP software are very slim, but JNOS is by
far
the easiest to get up and running and to keep that way.

My two cents worth, 73.

Source record: 44938

Hi Folks, Where might one find an ftp site with c-64/128 ham related
software?

I can find it for most platforms, but not the c64. Any help would be
greatly helpful!!!

Thanks.

I wouldn't call the error detection capabilities particularly sophisticated.
Each eight-bit character has one parity bit, and the message has a 16 bit CRC
checksum on the end.

Source record: 44840

Hi again:

I'm sorry and let me apologize, a lot of people will get furious
after reading this post but that's ok, I do understand. I forgot
rule number one of any electronic gadget:

Thou shall always read the fonstromus manualus.

I decided to start using the scientific method. I took my scanner, put
it on the same frequency and listen. Each time the thing was supposed to
transmit, it did not do a thing. Then I said to myself "Hmm, let me check
the cable". I saw a post here that the HTX-202 is very similar to the ICOM.
Well, so I got the ICOM/Yaesu cable for Handhelds. Guess what, the PTT
is not connected in those cables. (VOX maybe?). The HTX-202 needs
a PTT signal. Of course it is not going to transmit, it does not
know when. Well, it looks like it is time to test MFJ's money back
policy and I'll guet the open ended ones and I'll do the cabling myself.
Thank you for bear with me, I'm just an utter novice.

664. Update on TAPR 95 Annual Meeting

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-10 08:16:05 UTC
From: gjones@tcet.unt.edu
Message-ID: <3hf7c5$pl6@hermes.unt.edu>
Source record: 44851

TAPR 1995 Annual Meeting
March 3rd - 5th, St. Louis, Mo.

Annual meeting preparations continue and preregistration has been steady. If you think you will be attending, you can save some money and help TAPR set reservation levels by preregistering. The meeting is set for March 3rd, 4th, and 5th, 1995, in St Louis, MO. Information will be mailed to all preregistered folks before the meeting. If you are staying at the hotel, it is HIGHLY recommended that you make your room reservations as soon as possible. When making reservations, indicate that you are attending the TAPR meeting. The annual meeting hotel is Henry VIII, (800) 325-1588, in MO call (800) 392-1660. It is located on Lindbergh (US 67) one-half mile north of I-70 and one mile south of I-270.

Meeting Registration and TAPR Hospitality room will open in the Henry VIII hotel starting at 12noon on Friday in the London room. The room is located directly above the hotel lobby. On Saturday, registration will move to the College.

There have been a lot of questions concerning the Friday DSP symposium. First, the cost of the symposium has been dropped. Everyone who has preregistered and paid for the Friday symposium will not be charged. The reason for this change is that there are now no associated costs with the symposium. In addition, the dinner will no longer be offered, since it is now planned to hold the symposium from 3pm till 6:30pm on Friday. This will allow everyone attending the symposium, to make the TAPR informal dinner on Friday. The purpose of the symposium is to bring DSP programmers together to discuss tools and programming techniques. This is for those working with DSP technology. Location for the symposium will be provided with the preregistration packet and be available at the hospitality suite on Friday. Currently it is planned for the hotel, but this might change to college depending on space at the hotel. Jon Bloom, KE3Z, will be hosting the symposium.

Friday evening around 6:30pm to 7pm, TAPR will host its informal dinner. Location for this event has not be determined as of this writing. Contact the office, preregister, or come by the hospitality after 12noon Friday to get the location. The hospitality room will open again after dinner to provide a location for late night discussions.

The annual meeting formally begins Saturday morning at 8:30am with presentations and papers, as well as discussion on other projects of interest throughout the day. Registration will begin at 8am. The location will be the St. Louis Community College at Florissant Valley, 3400 Pershall Rd, along I-270, east of I-170 and west of West Florissant Ave. The TAPR

meeting will be held in the Theater, which is on the north side of the campus. Parking is available to the west of the buildings. If you need to drop someone off or require handicap parking, a driveway runs directly in front of the theater.

For Lunch on Saturday, TAPR is working on providing lunch at a slight additional cost for those that do not want to venture off campus. Lunch was not included in the original meeting price, because it was expected that the main food area would be available for our use. As of late December, the college has scheduled a major event which now occupies these areas and eliminates our ability to offer an open lunch. If you think you would be interested in Lunch, please can contact the office and put your name on the lunch list. Money for lunch will be collected Saturday morning during registration.

The tentative schedule as of this date is listed below. Lunch is scheduled from 12noon till 1:30pm when the afternoon session begins. The last session of the day will be a breakout for two discussion topics. Currently HF digital communications, hosted by Johan Forrer, KC7WW, is one of these. Some table space will be provided in the foyer of the theater for those wishing to setup demos or handout materials. If your regional group wishes to provide handouts to be distributed at the meeting. Contact Mel Whitten, K0PFX, k0pfx@tapr.org, annual meeting chair for details on either subject.

After the last session at the college, dinner will be held back at the hotel. The dinner will include a speaker and prize drawing! After dinner, Special Interest Groups will meet to discuss issues. On Sunday, two half-day workshops will be held. One will focus on Error Correction Techniques, by Phil Karn, KA9Q, while the second will focus on higher level interests for the development of hardware/software for the TAPR/AMSAT DSP-93, by Bob Stricklin, N5BRG. The workshops will be held at the College.

Transportation between the hotel and college, for those not having cars, will be made available. TAPR will be renting one 15 person van as a shuttle to run throughout the day and several St Louis hams have volunteered the use of their vans during the morning and evening rushes. Full details on the van schedule and times of transportation will be sent with preregistration information and be available during registration on Friday. If you think you need will require the use of transportation, please inform the office so we can estimate a count.

All indications show that this will be a well-attended annual meeting and we are hoping that the weather cooperates. See you in St Louis.

==========

Tentative Schedule as of 2/10/95.

March 3rd, Friday

12noon Hospitality Suite / Registration (Hotel, London Room)
3:00pm - 6:30pm DSP Developers Symposium (Hotel, Room TBD)
7:00pm - 8:30pm Informal TAPR Dinner

9:00pm NETSIG Meeting (Hotel, Room TBD)
9:00pm Hospitality Suite Re-Opens (Hotel: London Room)

March 4th, Saturday

8:00am Registration at College (Theater) Opens
8:30am - 10:00am Session 1
10:00am - 10:30am Break 1
10:30am - 12noon Session 2
12noon - 1:30pm Lunch
1:30pm - 3:00pm Session 3
3:00pm - 3:30pm Break 2
3:30pm - 5:30pm Session 4: Breakout Sessions
a) HF SIG / HF Digital Issues (Theater)
b) TBD
7:00pm - 9:00pm Dinner / Speaker / Prize Drawing (Hotel)
9:00pm PresidentUs Open Discussion (Room TBD)
BBS SIG Meeting (Room TBD)
APRS SIG Meeting (Room TBD)

March 5th, Sunday

8:00am Registration at College (Theater) Opens
8:30am - 11:30am Half-Day Workshop:
Error Correction Techniques, Phil Karn, KA9Q
12noon - 3:30pm Half-Day Workshop:
TAPR/AMSAT DSP-93, Bob Stricklin, N5BRG

666. TAPR Information and Internet Access

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-10 08:34:00 UTC
From: gjones@tcet.unt.edu
Message-ID: <3hf8do$q04@hermes.unt.edu>
Source record: 44852

**** NOTE: New FTP and WWW access ****
See below for new information.

Periodic Announcement - TAPR Information and Internet Access

Greetings from TAPR!

TAPR can be reached via the Internet. The Automated Information Server that TAPR provides allows anyone to request information on TAPR, products, newsletters, and lots of other files. To find out more about this service, send an e-mail message to listserv@tapr.org with the subject line "Request" and the following text in the body of the message:

help (for a brief set of instructions)
index -all (for a list of all file by topic area)
list (for a list of TAPR Mail Groups)
get tapr taprinfo.txt (or info on TAPR)

In the above message example, "help" retrieves a brief set of instructions for info, "index -all" retrieves a list of available files by topic and "taprinfo.txt" retrieves a text file containing information on TAPR and what TAPR is all about. If you want to retrieve several text files with one message, use a separate line for each "get filename" request.

General Information:

* Ever heard of a TNC ?

* Interested in general packet radio information?

* Interested in high-speed packet operations?

* Interested in other types of digital communications?

* Interested in experimenting or building kits?

* Interested in keeping up-to-date on national digital and packet issues?

Then you might be interested in TAPR!

Goals:

% Support Research and Development efforts in the area of amateur digital communications

% Disseminate information on packet and digital communications

% Provide affordable and useful kits for experimenters and hobbyists

% Pursue and help advance the amateur art of communications through publications, meetings, and standards

History:

If you have used a packet radio TNC, then you are already a part of TAPR history.

The TNC (Terminal Node Controller) project grew from a discussion in October of 1981 at a meeting of the Tucson Chapter of the IEEE Computer Society. A week later, six of the attendees gathered and discussed the feasibility of developing a Terminal Node Controller that would be complete and available to amateurs at a modest cost. This was the genesis of TAPR.

On June 26th 1982, Lyle Johnson, WA7GXD, and Den Connors, KD2S, initiated a packet contact with the first TAPR unit. The project progressed from these first prototype units to the TNC-1 and then finally to the TNC-2 which is now the basis for most amateur packet operations worldwide.

TAPR was founded in 1982 as a national organization with interests in the areas of packet and digital communications. Today, TAPR continues as a membership supported non-profit amateur research and development organization. TAPR currently has more than 2000 members, worldwide. TAPR continues to develop kits for the amateur community and is working actively on publications and communications standards.

Membership:

Membership in TAPR includes a subscription to the quarterly published Packet Status Register newsletter. PSR has been published since 1982 and is recognized as an authoritative source for up-to-date user and technical information on packet radio. Much of the material in PSR is timeless. Back issues may be obtained from the TAPR office. Membership in TAPR is $15 for one year. In Canada and Mexico membership is $18 and outside North America they are $25.

Join the amateur digital-revolution -- Join TAPR!

Special Interest Groups

TAPR maintains several SIGs in various areas. To get the latest list of SIG groups, send an e-mail message to listserv@tapr.org with the subject line "Request" and the following text in the body of the message:

list (for list of mail groups on TAPR.ORG)

To request the information on any mail group, send an e-mail message to listserv@tapr.org and in the message text include:

information listname (where listname is the name of the mail group)

When you are ready to subscribe, send e-mail to listserv@tapr.org with the
following command in the message text:

subscribe list First_Name Last_Name

List should be the name of the mail list you want to join and Your Name
should be both your First and Last Name.

Current SIGs include:
NETSIG Regional Networking SIG
BBSSIG BBS SIG
HFSIG SIG on HF Digital Topics
DSP-93 SIG for those that are building TAPR/AMSAT DSP-93 kits
APRSSIG SIG on APRS

FTP users

The TAPR Software Library is now available via anonymous FTP. You can
access the library by ftp access to 'ftp.tapr.org' in the directory
/tapr. Login in as 'anonymous', with a password of
'your_account@internet_address'.

Packet Raido and TAPR is on the World-Wide-Web!

The series is accesible through the Packet Radio Home Page at this
URL:
http://www.tapr.org/tapr

What's here? A page of links (the Home Page), the TAPR Home Page, a page of
Packet Pioneers and Contacts, a hypertext packet primer and FAQ, and more.

Thanks to Howie, N2WX, for his support and invaluable contributions of
the TAPR page.

>Thank you for bear with me, I'm just an utter novice.

The HTX-202 *does* use the same cable as the Yaesu. The PTT is combined with the audio-in line in the form of a "leaky" PTT. That is to say, the audio line is pulled toward ground by a resistance connected to the TNC PTT line. In the case of the Yaesu and Radio Shack radios that resistance needs to be no more than 2.2 kohms. For an Icom, it needs to be about 10 kohms. Recheck the cable, it should have a resistor buried in it somewhere. Make sure it's a 2.2 kohm resistor. The same cable won't usually work for both Yaesu and Icom. Here's a drawing:

```
TNC AF out--------------------x---------------------> HT mic tip
|
TNC PTT out-----/\//\/\/\----x
2.2k Yaesu/RS or 10k Icom
TNC AF in<-------------------------------------------HT ear tip
TNC GND----------------------------------------------->HT ear shell
```

An alternate wiring that works for both Yaesu and Icom as well as the Radio Shack unit looks like this:

```
TNC PTT------------))))))))----------------------------->Ht mic tip
========= 1:1 AF transformer
TNC AF out----------))))))))-x
|
TNC GND----------------------x------------------------->HT ear shell
```

TNC AF in<-- HT ear tip

You can get little interstage AF transformers in grab bags from
Radio Shack.

>policy and I'll guet the open ended ones and I'll do the cabling myself.
>Thank you for bear with me, I'm just an utter novice.

That's strange...I made a cable for my PK-88 according to the Icom instructions which are the same as the Yaesu instructions and it has worked flawlessly on my Icom AND my HTX-202...Good luck with your endevour!

Hi Marshall.
What TNC are you using I wonder ? UltraPak is only designed to work with
TNC-2 compatibles at the moment (it will be extended to others shortly).
If you can give me as much info. as possible, I'll try to help you out.
I wrote UltraPak, so it's in my interest to get you going !

Cheers, Tim Kearsley G4WFT.

Source record: 44859

TNX for reading this post.

Is it possible to use Baymodem in a TCP-IP network?
I tried with a version of WNOS and an AX25 software driver and seemed
it worked fine, but there were several warnings and error messages.

Can anybody help me, sending me his AUTOEXEC.NOS?
Thanks in advance and sorry for my poor english.

673. Ten Days until Green Key Night

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-10 18:52:13 UTC
From: haynes@cats.ucsc.edu
Message-ID: <3hgckt$8mq@darkstar.UCSC.EDU>
Source record: 44866

Get your Teletype oiled up, your boatanchor (vacuum tube) rig fired up, your antenna up, and get ready for Green Key Night on Feb 20.

Green Key Night is to commemorate the beginning of amateur FSK RTTY on the HF bands, Feb 20, 1953, and to remember the pioneers of amateur RTTY such as W6AEE, W6NRM, and W0BP. There are no rules, no scorekeeping, and no fixed hours. Just get on the air, use a mechanical teleprinter if you can, use vacuum tube gear if you can, use 850 cycle shift if you can, but in any case have fun, wallow in nostalgia, and let your RYRYRYRY be printed.

Did you start the tip (with modem option) daemon ?

"start tip slip0 modem 7200"
will start a tip / terminal server on the interface
called slip0 for a modem with a 7200 sec timeout.
this should do it.

Message-ID: <rlong-110295081725@slip2-13.acs.ohio-state.edu>
Source record: 44860

Hello,

I have an overseas friend who asked about speeding up an
older Tiny-2 tnc for better use with a 9600 modem.

The company sells an upgrade for $25 with a blank eprom
and $15 more if the eprom is programmed. Sounds kind of odd.

Can anyone tell me if the upgrade is just a change in xtal
and a different Z80? One of my catalogs shows a 10 MHz xtal
for 89 cents and a 'non-segmented Z8002B 10 MHz cpu for $10.
Or is it more, like a daughterboard?

73,
Ron w8gus.

Gary,

Isn't there usually a 0.1mfd capacitor in the audio line as well? Something like this

0.1 mfd
TNC AF out-------)|-----------x---------------------> HT mic tip
|
TNC PTT out-----/\//\/\/\/----x
2.2k Yaesu/RS or 10k Icom

Just a thought. 73, Larry

HI Jim,
I believe in the kpc-4 it uses the command CD for carrier detect mode. There were a couple of different ways carrier detect could be used. By the firmware or by radio device connected to the xcd pin of the radio port. I don't know off the top of my head which pin that is but you should be able to see it in the manual.. on my 9612 it is pin 2. Probably the same on the kpc-4. Don't have either one of my kpc-4's anymore although I should have a manual set in the closet here.. Version 3.0 fimware manual I think.. Look up the command CD and see if that helps...

Every TNC I've examined already capacitor couples AF out with a
capacitor internal to the TNC. There's no need to duplicate
that outside the TNC as well.

Gary

Emarit;
A half-meg .wav file is not an appropriate post to this Usenet group.
Many people (fortunately not *me*) pay to receive every message in a
group when they read it, and any one who inadvertently takes a look-see
finds himself downloading for the next 10 minutes.

Hello And Thnaks For Reading,

My Local Amateur Radio Club Wants To Start A PBBS For All Club Members To Use. I Have Been Put In Charge To Find Out Which PBBS Softwear Package Would Be Better For Our Needs MSYS Or F6FBB. What We Basicly Are Looking For Is Something That Is Simple To Use And Versatile. All Comments Will Be A Great Help!

Source record: 44875
Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave,uk.radio.amateur,rec.radio.amateur.digital.misc

To all who tried to access the Kentrol Web pages last week and got an error message: Please come back; it's working now!

My Internet provider had a major crash on Feb.5, and the Web server was out of action until Feb.10. The crash was just a couple of days after the release announcements for Kentrol 5.0 and SkedMan, so lots of folks have been denied the opportunity to see just how good computerized rig control has gotten.

All is well again so you can read about, preview and download the best in hamware with this URL:

http://www.synapse.net/Kentrol/Kentrol.html

There is also an archive of Kentrol and SkedMan executaables and documentation accessible by anonymous ftp, located at:

ftp.synapse.net/shareware/kentrol/

We're glad to be back.

)>processing TNC's use an FSK connection into the HF radio?
)
)With a properly adjusted SSB transmitter, and pure tones,
)AFSK over SSB is indistinguishable from FSK. Of course
)those two qualifiers can be killers in the real world.

This is where the trouble starts. The other thing, besides getting the tones correct, is setting the audio levels on those tones. There's been a lot of stuff in the Digital Journal (formerly known as the RTTY Journal) about the incredible number of overmodulated signals on Pactor and other digital modes.

Pactor is supposed to be narrow, allowing 500Hz width. An overdriven signal will occupy 2 or 3 kHz. One of the nice things about using FSK over AFSK is that the RIG is responsible for the modulation. The TNC just tells the rig when to shift the tone.

Now some will bring up that many newer rigs really just have an internal audio oscillator, and don't TRULY run FSK. This is quite true. The FT-990 I use is set up this way. However, the chances are pretty good that the audio oscillator has a better chance of being set at proper modulation level than the average TNC to radio audio connection.

Just as with VHF packet, where a significant percentage of users do not set up their TNCs correctly and wind up overdeviating, it seems that a lot of folks discovering the HF digital subbands do not properly set up their TNCs when using AFSK connection to their HF rig.

Of course the other argument for using FSK over AFSK is that most radios that have the FSK option also only give you the narrow (eg. 500Hz) filters to use when in FSK mode, and those narrow filters are QUITE useful. In contests my station is always set up at 500Hz, unless on 20 meters, where the 250Hz filter is sometimes needed. Stations are that close together...

Good point, Gary, but some of the older ones do not (such as the MFJ 1270) and some of the newer ones, such as the PacComm Tiny 2 rev 1.8 board require that you configure jumpers on the board. I just thought he should be made aware of it.

I believe that the speed upgrade consists of the xtal, and both the SIO
and Z80 higher speed processors. The blank eprom is for folks who want
to run X1J, TheNet, Rose, etc., and prefer to burn their own.

I really don't see what the problem is, unless the original post (which I
never read) contains soemthing I'm missing.

Does the original poster want a simple terminal program? If so, Linux's
Minicom should do the trick (or any other terminal program).

ftp.cdrom.com, among other Linux/Unix FTP sites, should carry terminal
programs.

kermit.cc.columbia.edu has a compilable Kermit.

Hope this helps.

If you make a habit of posting 300K UUcoded messages to non-binary
newsgroups you are definitely in need of some help.

Please remember that some of us have to pay to download crap like that.

It sure is possible! I always run mine in this mode and it works just
fine. The command is "CD SOFTWARE" (See under CD in the Commands
Manual.) You may need to adjust the equalisation by means of an
internal jumper if the RCV light tends to flicker .... this is described
in the hardware manual.

707. 9660 baud Modification for Yaesu FT-311RM

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-13 12:30:08 UTC
From: zephd@iquest.net
Message-ID: <D3xGu7.DMG@dorite.use.com>
Source record: 44889

We're using a 19.2Kb backbone to link PacketClusters in Central Indiana with those in Ohio. However, the links from the Clusters to the backbone still run at 1200 baud.

I'd like to start modifying pairs of radios to link the Clusters to the backbone at 9600 baud. Fortunately the radios in each pair are the same, but of course each pair is a different brand!

The one I'd like to try upgrading first uses a pair of Yaesu FT311RM transceivers. Does anyone on the Reflector have data on modifying these radios for 9600 baud operation?

Thanks and 73 ---> Dave, W9ZRX (zephd@iquest.net)

Here is a little information about XPKAM.

Current version : 1.55

Supports : KAM and KAM - Plus (6.0 or higher firmware)
Full HOST mode operation.

Mode Support : All modes including GTOR and TOR modes.

: Monitors GTOR with using external programs.

Features : Mouse operation
Multiconnect packet, each in it own window.
External call book support (SAMS, QRZ, Buckmaster)
ANSI color support
Extensive Macros for simplying exchanges
Host mode operation
Cut and paste from the screen using a mouse
Built-in log with autosearch and save
Transceiver control for many popular radios
Pull Down menus
And a bit more.

Availability : The programs are available via anonymous FTP
at ftp.indirect.com, the bbs listed in the
signature of this message or CompuServe.

I can't compare one to the other on the other modes (amtor, pactor) but
I have found g-tor to be very robust in high QRM/QRN. There just are not
too many folks using it yet. My KAM Plus has performed very well so far.

I'm the original poster. I am looking for something a little more
robust than minicom. Something that will give me a receive and transmit
windows, multiple connects, and a rudementary mailbox. All this for a
Cheesy PK87.

The wa8ded code for the pk87 intrigues me... I will have to look for it.

713. Running a MUD via radio.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-13 17:55:24 UTC
From: pete@freenet.grfn.org
Message-ID: <3ho6ec$nf8@locutus.Bethany.ORG>
Source record: 44795

Does anyone know the legal ramifications of running a mud via packet?
I have a nice Linux setup, with a circleMUD running on it. I thought
it might be fun to offer this to my local packet community.

It's obviously not business related, yet not radio related communications.
This is a gray area with me... does part 97 define this?

thanks!

I'm looking for a diagram to build a cable to connect my MFJ-1270B to
an Alinco DJ-580 handheld.

Could someone either Email me the info, or tell me where I could
get it.

Thank You, =-=

How about using 2400 baud phone modems on packet? They didn't need a
training sequence.

>removal of ignition noise? Thanks in advance.
>--
I can't recommend a DSP unit, but the unit you mention does not have
any DSP noise reduction other than bandwidth reduction, regardless of
statements in the catalogue. It could help an old receiver with a wide
IF by reducing the bandwidth (and does remove hetrodynes by
DSP.) Any of the other DSP units should be effective in removing
ignition noise.

From: martinbw@ten-nash.ten.k12.tn.us
Message-ID: <9502131831.AA52551@oscar.cayman.adclab.bls.com>
Source record: 44800
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

My club is considering putting up a weather data gathering system. We would like to be able to track wind speed and direction, rainfall, temperature, and possibly pressure. We may possible have multiple sensors at different heights on the tower (bottom and top) We would like to sample the data and write it to a file on a computer at the gathering site. We would like to then be able to use packet to access the computer and look at the data and possibly download some portion of the data. We would also like to use the packet system as an node.

We are considering using a 386sx with a couple of 60MB SCSI hard drives for the computer.
A Kantronics KPC-3 for the TNC.
A Kantronics weathernode or a Davis weather station.
Possibly a GE Master II or Master Pro for the radio.

Has any body done something like this? Is there some software that will assist us in making this work? Have I forgotten anything?

TIA
Bruce

Might I suggest PacketPeT For Windows. It works with most TNCs, and
there is a shareware version widely available. The latest version is
2.04 by the way. You can find it at the ftp sight at oak.oakland.edu,
and at the QRZ CDROM sight, as well as on CIS and AOL.

I have received, this morning, private E-mail from the person who
originally posted this ridiculous message. He "flamed" me for daring
to challenge the posting of such inappropriate material - saying that
_I_ am the one who is selfish, and that I have no right to make reference
to the cost of downloading such enormous files.

Boy, do some people have thick hides!

I can't speak for the US, but over here you DON'T have to have an IP address; the simple system - text-based only (though some PC users may go via a Windows prog. of course) - is just by logging on to your local BB, which will tell you if you have mail, and allow you to send mail and bulletins and read bulletins.

For example I am just G6JPG@GB7NNA, or to give in full G6JPG@GB7NNA.#34.GBR.EU (I think the #34 is right). I don't use tickypip over packet. (When messages that have originated on tickypip systems reach packet, they often have the full 20 or 30 lines of header; although a good reader can conceal this, the capacity of the system is always full anyway, and such headers - and quoting previous messages in full! - doesn't enamour you to other users!)

Another activity that can be pursued with just a text interface is node hopping - you connect to a node you can reach, and then to another it can reach, at which point it appears to you (apart from increased response time) as if you are connected directly to that node, and so on. Not everyone's idea of fun, but I know a (retired) ham who likes hopping around Europe, having reached I think Moscow this way (in small hops!).

P. S. - I didn't mean we don't HAVE TCP/IP; just that you don't HAVE to have it.

It has many advantages, but requires more setting up, and for full benefit of
the advantages, your system left on all the time (not allowed on some bands
here).

>board require that you configure jumpers on the board. I just thought
>he should be made aware of it.

I normally use the transformer circuit, so I'm generally not concerned about the capacitor, but I just went and checked a real TNC2, an old MFJ1270, the PacComm Tiny 2, and a new KPC-9612. The TNC2 and 1270 have C33 and C34, a pair of .1 mf capacitors in series with TxA. The Tiny 2 has C8, a .1 mf capacitor in series with it's TxA lead. And the KPC-9612 has C14, a 1 mf capacitor in series with it's audio lead. Now there may be variations I haven't seen, and other TNCs by other manufacturers that don't have the cap, but these do.

I do not like the RC circuit for keying because of the increased delay it introduces. With the Icom 10k resistor, you're looking at an additional keyup (and key release) delay of about 10 ms when using the RC circuit with the TNC2, MFJ, or Tiny 2, and 100 ms with the Kantronics, 200 ms if you have the EQ jumper installed. That may not matter if you're running a long TxD, such as 400 ms, but for best performance, a shorter TxD is preferred, and the RC time constant can be a limiting factor.

Yep, and Kantronics marketed the KPC-2400 to do it. Unfortunately,
the turnaround delays and overhead meant that you didn't get much
throughput improvement over 1200 baud. Not enough to justify trying
to convince everyone else to changeover anyway. Now 9600, that's
a significant enough improvement to consider.

I don't see anything in Part 97 that prohibits this sort of message
content. Are you under the impression that the content of every
amateur transmission must be directly related to radio? It would
be mighty dull on the bands if all we could talk about was radios.
This is as legal as the postal chess matches held on 40 meters,
or the old duffers talking about their latest surgery on 75 meters,
or the morning crowd talking about the traffic on the expressway
during their commute on 2 meters. The content of none of those
transmissions is radio related either, but they're legal.

The controlling rule is that the content be of such an unimportant
nature that resorting to commercial communications services is not
warranted. OTOH, I hear that MUD can be so addicting that players
will rack up huge phone bills playing it. (I don't play.) So it
might be considered as taking business away from the phone company
if some real addicts engaged in playing MUD over the air.

TAPR sells a kit called METCOM that's a little single chip micro
designed for interfacing remote telemetry instruments to a TNC.
That would do for realtime readings. For gathering a lot of data
and forwarding it on demand, a different approach, like the one
you outlined, would probably be better.

I'd suggest using Desqview. Run your data logger in one window, and
NOS in another. You can then ftp the log files down from the site
any time you like. Linux would be even better, but you'd have to
write your own instrument logging software. With Desqview, you can
use the DOS data logging software supplied with the instruments.

(You might be able to use Linux's dosemu to run the DOS logging software.
I haven't tried running realtime DOS interface software under dosemu, so
that might or might not be practical.)

You've probably had enough flames about the large file - 'nuff said.

As to the original question, no, I can't, but it sounds like nothing I've heard on HF. I assume you got it from a VHF+ source. It sounds like either paging or telemetry of some kind, since t sounded bursty. It also sounded like it had a rather high data rate, since the bursts started to sound like white noise. (The more it sounds like noise, the higher bandwidth utilization you've got.) There were also what sounded like signalling tones - the slow transitions of pitch. Not sure what they're for. If you told us what freq you heard it on, we might be able to help more.

Hi everyone,
I just bought a mfj 1278b data controller and am hookong it up to my
Kenwood TS-940s transciever. the question is is it better to connect thru
the mic/ phones jack or use the fsk input on the back of the rig.
also for rtty, my rtty section was ripped out of my kenwood manual, so can
i go 100% power? thanks in advance!-steve wi0e

The command is CD SOFT

If it is not there in your KPC-4, then you will need an
updated eprom from Kantronics.

It might be true that older kpc-4 do not support software
carrier detect ...

Open squelch operation is a "good thing" (tm)

> please help.
>
> de Brian, JARVIS@HFRD.DSTO.GOV.AU
>

Hi Brian,

Assuming that your PK-232 has December 1988 or newer firmware (one of
the vast majority) , all that is needed to put the PK-232 into KISS
is to use the 'KISS ON' command. The TNC immediatly switches to KISS mode.

KISS does not use normal text-oriented commands, and that's why you
don't get a 'cmd:' prompt.

After you've entered the KISS ON command, exit your terminal program and
start NOS. If you've got your 'autoexec.nos' file set up right (right
COM port and baud rate), your station should at least be able to transmit.
Depending on the vintage of NOS you are using, you will probably need to
add the following commands to your 'autoexec.nos' file to insure the
hardware handshake lines from the serial port of the computer to the
PK-232 are set correctly:

param <interface name> dtr 1
param <interface name> rts 1

Replace <interface name> with the name you used on the 'attach asy ...'
command line in your autoexec.nos file to refer to that com port.
Common names are 'ax0', 'ax1', and 'tnc'.

Also, you must use an RS-232 cable with more than the minimum 3 wires
needed for minimal serial communications when using an AEA TNC. This is
all because AEA's TNCs obey hardware handshaking. Note that the factory
supplied cable meets this requirement.

If you wish to exit KISS mode, prior to leaving NOS you can use the command 'param <interface name> 255' to tell the TNC to switch from KISS mode to terminal-oriented command mode. Alternatively, in your terminal program, you can do the following:

1) Type nothing for one second
2) type exactly three control-C charachters, within one second (i.e., hold the control key down and tap the 'C' key three times, quickly).
3) Wait one second
4) If command mode is not restored, try above again. Double-check baud rate and be sure to use 8-bit, no parity serial communications.

So, to recap:

1) Use KISS ON to set the TNC into KISS mode.
2) Make sure your RS-232 cable has RTS and DTR connected.
3) Make sure your NOS configuration sets RTS and DTR to true.
4) Make sure your NOS configuration properly sets up COM port address, interupt, and baud rate.
5) Use the proper param command or 3 control-C's to exit KISS.

Hope that helps!

> Gerry K8EF@W8CQK.OH.USA.NA
>

Hi Gerry,

Unless AEA has changed their policy (in the last 11 months, since I worked for them), it is very possible to upgrade your PK-232 to the current capability, and for a lot less than buying a new TNC. As an example I have PK-232 serial number 10. Yes, that's a real serial number, as I was one of the original 50 beta testers. My PK-232 has all the latest hardware mods, plus a 9600 baud packet modem, all integrated within the TNC.

At last I knew, the upgrade for the PK-232 to MBX with PACTOR firmware was about $125 including shipping, and at least used to get you a brand new manual, much needed because of all the features added.

The installation is straight-forward, involving removing the cover, unplugging 1 or 2 RAM chips and 1 or 2 ROM chips, depending on the vintage of your PK-232. A single wire must be hooked around a resistor lead and soldered. This lead plus two 28-pin headers connect a daughter circuit card to the PK-232, replacing the components you removed. They just plug into two of the four empty sockets on the main PK-232 PC board. The other two sockets stay empty. AEA also supplies standoffs so the PC board can be securely mounted in the TNC, and fairly good step-by-step instructions for completing the installation.

If the soldering iron is hot, this upgrade ought to take you less than an hour. It took me less than 10 minutes, including removing and reinstalling the cover, but I got lots of practice.

The most common mistake made when installing the upgrade kit is making sure all RAM and ROM chips (all the 28-pin chips) are unplugged from the main board before plugging in the daughter board. A lot of guys missed or misunderstood the instruction to remove all four possible 28-pin chips. I probably talked to 1 or 2 guys every week for over 4 years who'd made just this error.

Anyway, I hope this helps. Your PK-232 can have a new life for a lot
fewer bucks than buying a new TNC.

From: rdonnell@eskimo.com
Message-ID: <hlUGlWml1q52078yn@eskimo.com>
Source record: 44821

Sorry that I can't do a comparison. As far as HF performance goes,
you'd notice a significant improvement on Baudot and AMTOR with the
PK-900 vs. the PK-232. I found the tuning display on the PK-900 to be
much better than that of the PK-232 for tuning in weak Hf signals.
When I was with AEA I was consistently impressed with how much
better the optimized HF modems in the PK-900 were at digging out
the poorer quality signals than a PK-232 connected to the same
receiver at the same time.

If the KAM Plus is using a TCM-3105 modem chip for 1200 baud operations,
I suspect it will be better than the PK-96 for 1200 baud operations.
Historicly the TCM-3105 based TNCs have seemed to work better (more
tolerant of various quality signals) than the AMD7910 chip that AEA's
been using since the PK-87.

Hope that helps a little.

>I am looking forward to getting some responses. Thank you.

Depending on the modulation, they can be the same thing, or different.
For simple amplitude modulations, they are equivalent. For wideband FM
modulations, or for multiplexed data, they will be different. CNR is
the carrier to noise ratio while SNR is the desired signal to noise
ratio. For example, a satellite FM video signal may have a CNR of only
7-10 db while having a video baseband SNR of 45-50 db thanks to the
FM improvement factor of the 30 MHz wide signal.

This becomes a really important distinction for things like spread
spectrum. The CNR may actually be below the noise floor while the
SNR can be quite good after despreading and correlation.

The CNR is a raw amplitude ratio between the received carrier and
the noise. The SNR is the ratio of the demodulated signal to the
demodulated noise. At least that's the way they are used in practice.

Hello,

The message below turned up on packet here a while ago, it brings up an
important topic:
Although really something has to be done against abuse of the
packet network, I think that the way it is handled by KG4GBS
is not right. Remember that callsigns do get abused and
everyone can easily end up in such a hold list,
how is he going to prove it, when it was not his fault?

73, Moritz DL5UH

KB4GBS > BB 11.02.95 00:55 38 Lines 1355 Bytes #1 @WW
BID : 18463_KB4GBS

!HA5OB!WB0TAX!TPA1FL!W4DPH!KC4HAZ!KB4GBS!
Sent: 950210/1832z 18463@KB4GBS.EL88MC.#TPA.FL.USA.NOAM

Each year I clear the hold files and start over.
Stations sending really bad words, or trying to sell
obviously very commercial products are banned.

ALSO banned is any traffic from the originating SYSOP's bbs
of the above mentioned traffic... The way I look at it, if
they are too lazy to screen what originates on their BBS,
the world need not their traffic.

Stations sending bad words or selling commercial meterial
since Jan 1st 1995 WA2IHI * PE1PTP * DG2EBM * HB9ZCW
AB5QW * N7DA

Sysops who have released unchecked into the system some of the above:

DK0MWX.#NRW.DEU.EU
LX0PAC.LUX.EU
KE2VN (for which I have no path)

BB=Blackball

I suggest other sysops show their disdain for stations who obviously
have no respect for Amateur Radio by sending or allowing to be sent
traffic that would violate the rules in any county on the face of the
earth, by doing the same and using the BB.

Each January 1st, I purge the list.... if a station reappears on the
list, they become a permanent lister..... so far, so good.... no stations

have mad the for-ever list.

It takes only a few minutes a day to release traffic created on your own system... and most private traffic isn't even included...

Fsk is better in most cases. The rec output to the tnc is fixed so you can change the volume to the speaker without affecting the operation of the tnc. As far as the power goes, I don't recommend running more than 50 watts on rtty, even if the radio says you can. If you can't make it on 50 watts, chances are you won't make it at full power and at 50 watts you're going to get a lot longer life out of your radio.

Of course, this is mostly opinion and preference. 8^)

Jim.

The _ONLY_ place to post 350k+ messages is in the alt.binary.* and
put a flag in this group to indicate were it is posted. Your
posting of it here caused me to waste 5 to 10 minutes of my time,
a very unsocial act.

Not everyone uses a nice news readers were they can jump over
unwanted messages by hitting the "n", some people download the
entire file of messages posted to a group and read them on their
home system. People like myself are quite unhappy when some
clueless person post a 350k+ wave file to a discussion group.

Hi all:

I just got a Baypac TNC/Modem and would like to use my old Mac Plus as
my packet terminal. Can anybody help me with: a) Software and b)
Cable from Mac to Modem.

Very much appreciated.

Rafael (Ke6JSR)

You can get the files off ftp.tapr.org

Also - you can get files from listserv@tapr.org

We still have a few slots for the April shippment.

Cheers - Greg, WD5IVCDD

1995 TAPR Annual Meeting
March 3-5th, 1995 * St Louis, Mo.

==========

** See below for Saturday Lunch and Transporation Information

TAPR 1995 Annual Meeting Overall Schedule as of 2/17/95

March 3rd, Friday

12noon - 6:30pm Hospitality Suite / Registration (Hotel: London)
3:00pm - 6:30pm DSP Developers Symposium (Hotel: Windsor)
7:00pm - 8:30pm Dinner (Hotel: Windsor)
9:00pm NETSIG Meeting (Hotel: Windsor)
Hospitality Suite Re-Opens (Hotel: London)

March 4th, Saturday

8:00am Registration at College (Theater)
8:30am - 10:00am Session 1: Presentations
10:00am - 10:30am Break 1
10:30am - 12noon Session 2: Presentations
12noon - 1:30pm Lunch (Limited Box Lunch Special)
1:30pm - 3:00pm Session 3: Presentations
3:00pm - 3:30pm Break 2
3:30pm - 4:00pm Session 4: Presentations
4:00pm - 5:30pm Breakout Sessions
a) HF SIG / HF Digital Issues, Johan Forrer, KC7WW
(Social Sci 101)
b) Current Issues in TCP/IP, Barry McLarnon, VE3JF
(Theater)

7:00pm - 9:00pm Dinner / Speaker / Prize Drawing (Hotel: Wiltshire)

9:00pm Hospitality Suite (Hotel: London)
President's Open Discussion (Hotel: Wiltshire)
BBS SIG Meeting (Hotel: Windsor)
APRS SIG Meeting (Hotel: London)
PCS Technology Discussion, Tom McDermott, N5EG
(Hotel: Wiltshire)

March 5th, Sunday

8:00am Registration at College (Theater) Opens
8:30am - 11:30am Morning Workshop (Theater)

Error Correction Techniques, Phil Karn, KA9Q

12noon - 3:00pm Afternoon Workshop (Social Sci 101)
TAPR/AMSAT DSP-93, Bob Stricklin, N5BRG

==========

TAPR 1995 Annual Meeting Presentation Schedule as of 2/16/95

Times inside each session are approximate. Each session will begin on time.
Time will be available after each presentation for limited questions from
the audience.

Session 1, 8:30am - 10:00am (90 mins)

8:30am Welcome - Mel Whitten, K0PFX and Greg Jones, WD5IVD
8:40am DSP-based Multimedia Sound Cards for DSP Development Platforms:
Possibilities and Future Trends. Johan Forrer, KC7WW (25 min)
9:10am TAPR/AMSAT DSP-93, Overview. Bob Stricklin, N5BRG.
D93WE Windows Development Environment. Tom McDermott,N5EG (40 mins)
9:50am TAPR TNC-95 Project Update. John Koster, W9DDD (10 min)

Session 2, 10:30am - 12noon (90 mins)

10:30am Modem Channel Response. T. C. McDermott, N5EG (25 min)
11:00am A Simulation of the G-TOR Hybrid ARQ Protocol.
Phil Anderson, W0XI, Kantronics (25 min)
11:30am Considerations for Automatic Gain Control in DSP Receivers & Modems
Glenn Prescott, WB0SKX, and Richard Huslig, Kantronics (25 min)
11:55am Before Lunch Announcements

Session 3, 1:30pm - 3:00pm (90 mins)

1:30pm Advances in APRS Technology. Keith Sproul, WU2Z and
Mark Sproul, KB2ICI (25 min)
2:00pm The National Weather Service St. Louis, Missouri Packet Weather Wire
James P. Kramper, KB0NMT (25 min)
2:30pm Hierarchical Addressing Protocol. Dave Wolf, WO5H (10 min)
2:45pm Packet BBS Address Proposal, Karl F. Larsen K5DI (15 min)

Session 4, 3:30pm - 5:30pm

3:30pm Day of Meeting Presentations (TBA)
4:00pm Breakout Sessions
HF SIG / HF Digital Issues, Conducted by Johan Forrer, KC7WW
Current issues in TCP/IP, Conducted by Barry McLarnon, VE3JF.

Banquet Speaker

SETI Made Simple: What Can We Do?
Dr. H. Paul Shuch, N6TX

==========

Saturday Lunch Special

If you don't want to leave the campus to have lunch during the TAPR annual meeting, we have arranged with the college to provide a limited number of box lunches. The box lunch consists of a Ham Sandwich, Chips, Cookies, and Ice Tea. The cost of the lunch is $5.00 per person. If you wish to purchase a lunch, you can contact the office and pay for your lunch early or reserve a lunch for payment when you register at the meeting. There are limited lunches available.

Transportation

Van Transportation Schedule
We have transportation available for conference participants registered at the Henry VIII hotel that need a ride to and from the college. Please make your request with the registration desk, in the Hospitality Room (London), so a departure time may be assigned. Please be in the Hotel lobby a few minutes before departure. Look for the van's identified with a "TAPR TRANSPORT" sign. The hotel will also be providing us with transportation in their van. A conference committee member will be in the lobby to help direct you to the vans.

If you need a ride back to the hotel during the conference, ask someone at the registration table (theatre foyer). The van will be departing at the front of the college theatre. Transportation availability announcements will be made prior to the morning and afternoon sessions. A return trip to the hotel is scheduled at the end of each session. At the end of the day, every effort will be made to accommodate everyone on the first trip. If you have an opportunity to obtain a ride back to the hotel from someone at the conference with a car, please do. This will help us eliminate any delays due to transportation. Your cooperation is appreciated.

Hotel to College: Departure Times
Saturday and Sunday - 1st Run at 7:15am
Saturday and Sunday - 2nd Run at 7:55am
If needed, a 3rd run will me made at approximately 8:40am for those who forgot to set their alarm.

College to Hotel: Departure Times
Saturday (end of conference) - 1st Run at 5:30pm
Saturday (end of conference) - 2nd Run at 6:20pm
Sunday - 1st Run at 12noon
Sunday - 2nd Run at 3:45pm

For other departure times during the conference, speak with a Conference Committee member at the registration desk to help with transportation issues.

^^^^
Replace 'kiss' with 'ax25' and you should be in good shape. The 'kiss'
option has to do with 'addressable kiss', where with a special cable
you place more than one tnc/radio on the same serial port. This is
normally done with dual port TNCs or with serial port poor computers,
like laptops. Most 'publicly distributed' compiles of nos don't have
addressable kiss compiled in.

>
> My tnc is on com2 at 9600 baud.

>
> Does anybody know about whether this is true or not.
>

This too is true - if you are on a busy channel, or if packet sizes
larger than about 300 bytes are used in your area. The former because
if the PK-232 (or PK-87 or early PK-88) has to wait for access to the
busy channel, at some point when another packet gets queued for
transmission (received from your nos box, but not yet transmitted on the
air), an error in the firmware causes all subsequent packets to be
damaged, until the tnc is turned off and back on. This was fixed in AEA
products in the June or July 1990 firmware release, depending on whether
it was a PK-88 or PK-232. Upgrading the PK-232 to get around this
problem requires the upgrade to MBX at a minumum. Not sure if AEA is
still providing that upgrade without PACTOR - if they are, the price for
the upgrade is about $65 (plus shipping/handling). If not, it's more
like $125. I don't recall pricing exactly, and it could have changed in
the last year, too - and just noticed you're overseas - those prices are
in US dollars. If it is your specific intent to dedicate a TNC for
use with JNOS, I'd suggest getting a second TNC rather than the upgrade.

On the other hand, if you don't plan to dedicate the TNC, the upgrade is very worthwhile for the added functionality. You can send an email query to one of the following, who are at AEA. I don't recall the compu$erve email address that gets you right to service, but I'm sure either the President or the Vice President will answer your questions or pass it on to the customer service people.

Actually, you don't need COMM software - the terminal program in the Model 100 will do the job quite nicely. My portable packet station currently consists of a Model 100 clone (Kyotronic 85), a Paccom Tiny II, with NMOS replaced with CMOS for low current drain, and I usually use an IC-2AT. Note that I seem to remember hearing complaints about the key-up time on the micro-2AT - it may not really be fast enough for effective packet use. The size is nice tho. Because of the internal battery capability, today I'd either look at a Kantronics KPC-3 or the very small Paccom - tho you'll pay a premium price for that model of Paccom. I use a pack of 8 - AA cells to run the TNC, and of course the 4 AA's in the computer. The whole works goes into a foam-padded pistol case, along with extra radio cables, so I can take advantage of my mobile radio, etc if I'm in the car. I used this very successfully while providing support communications on a 26-day bike ride from Seattle to San Diego, about 5 years ago. I managed to pass about 50 NTS messages via packet BBSs on the trip - and that was a secondary role.

> chip is the culprit?
>

It does sound like somethign in the microprocessor section is dead.
Could be the firmware IC, but not necessarily. You'd probably have to
get ahold of another PK-88 or be familiar with microprocessor
troubleshooting to fix this yourself. The LED's coming on in random
patterns is normal - normally the microprocessor clears them to the
boot-up sequence you are used to - but so quickly you never see the
random pattern. That's not happening, which is what tells me your
problem is in that area. Leaving out the firmware guarantees that you
will see a random LED pattern - again, without firmware, the
microprocessor has no instructions on how to set the LEDs.

> Has anyone had previous experiences like this with a TNC?

Yep - used to work at AEA in the tech support dept.

>
> BTW=> Here is the info on the Firmware:

>
> Can you tell me the latest version for the model?
>
What you have is pretty late - but I think there was one or perhaps two
more upgrades offered after that. The PK-88 is not a currently produced
TNC at AEA any more.

> Finally, does anyone know if AEA has an E-mail address or a FAX number
> within Canada so that I might contact them directly?

AEA does not have a seperate Canadian service organization. Some
dealers will work on their equipment, but for factory service you'll
have to ship to AEA in Washington. Their FAX number is (206) 775-2340.
Since I can never remember the Compu$erve address, I know that email can
be directed to:

rproctor@u.washington.edu <- president of AEA
bill@halcyon.com <- vice president of AEA
>
> Any advice kindly appreciated.

If you don't have local resources to help you troubleshoot and repair
the TNC, definitly contact AEA. They do have a 'flat-rate' repair fee,
so they can quote a definite cost to repair the TNC. It's based on the
average cost in time and materiels. Unless your TNC is really fried, no
matter the problem, it should be repaired at the flat rate charge. That
fee does not include shipping out of the U.S., but they should be able
to quote that too.

>
> Please E-mail:
> ____
>
> Yvonne Dawe ydawe@calvin.stemnet.nf.ca

767. JNOS Documentation

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-17 16:14:40 UTC
From: kell@mpac.jsc.nasa.gov
Message-ID: <kell-1702951014400001@netguy.jsc.nasa.gov>
Source record: 44751

I'm looking for documentation about

1) JNOS - how to use it, and

2) How to navigate about the packet network, what should I be looking for,
and how do I use it.

Tall order, I know, but any help would be appreciated.

You might look at the TAPR METCON system in the January 1993 QST.
If you do develop a new system, keep in mind that a lot of people
are looking for examples of fully documented working source code.
Who knows, you could have the first amateur project that takes up
a full CD-rom!

Hello All:

I work mostly RTTY mode. I get lots of static. Sometimes I get interference. I have Kenwood TS450S radio and home brew interface and 486 computer. Can someone suggest what is best way to avoid these interferences by either using SSB filter or buying a DSP unit or CW filter.

I am new to this mode and I really like doing RTTY and like to stay with it. If can improve my reception, that will be great help.

Please help me in this regard.

Thank you very much for your time and suggestions.

Greetings,

If anyone has any Ottowa Amateur Radio Club's PI2 rev A cards available
to Sell, Loan, Barter or otherwise make available to us for a short 2-3
month period we would be very appreciative. These are hi speed 8530
SCC boards for AX.25 packet radio built in a half length IBM PC/ISA card.
As some of you may have heard the rev B cards have been delayed until April.

We have a short term need for 10-20 cards in March so that we can bring
more HAMs into our Bay Area proto/alpah network.

We are Tetherless Access, Ltd. a small startup in CA that was founded
by and is still run mostly by HAMs . Our web page is at
<http://www.tetherless.net/> .

Any help on sourcing a few is greatly appreciated.

My Nos works fine off line but when I go to the modem I get nothing. I have tried it with a pk-12 and the baypac with no success. Does anyone have an idea what is going on?

The tncs both work on the same port in native mode but I can't seem to get them to talk to Nos.

I am loading the ax.25 driver for the baycom. And the kisson script is working on the tnc.

When I start up nos it will key the radio for about a second. but that is the only interaction I see.

You have the right list server, but that may be the wrong command.

Send a message to listserv@hydra.carleton.ca with the one line "help", which
should give you the acceptable command syntax. I think it is

subscribe nos-bbs <your email address>

but the help file should give you what you want to know.

*** The IP address of TAPR.ORG is changing Monday (2/20) to
204.96.214.85

Here is the current TAPR.ORG information:

Periodic Announcement - TAPR Information and Internet Access

Greetings from TAPR!

TAPR can be reached via the Internet. The Automated Information Server that
TAPR provides allows anyone to request information on TAPR, products,
newsletters, and lots of other files. To find out more about this service,
send an e-mail message to listserv@tapr.org with the subject line "Request"
and the following text in the body of the message:

help (for a brief set of instructions)
index -all (for a list of all file by topic area)
list (for a list of TAPR Mail Groups)
get tapr taprinfo.txt (or info on TAPR)

In the above message example, "help" retrieves a brief set of instructions
for info, "index -all" retrieves a list of available files by topic and
"taprinfo.txt" retrieves a text file containing information on TAPR and what
TAPR is all about. If you want to retrieve several text files with one
message, use a separate line for each "get filename" request.

Membership:

Membership in TAPR includes a subscription to the quarterly published
Packet Status Register newsletter. PSR has been published since 1982 and is
recognized as an authoritative source for up-to-date user and technical
information on packet radio. Much of the material in PSR is timeless. Back
issues may be obtained from the TAPR office. Membership in TAPR is $15 for

one year. In Canada and Mexico membership is $18 and outside North America they are $25.

Join the amateur digital-revolution -- Join TAPR!

Special Interest Groups

TAPR maintains several SIGs in various areas. To get the latest list of SIG groups, send an e-mail message to listserv@tapr.org with the subject line "Request" and the following text in the body of the message:

list (for list of mail groups on TAPR.ORG)

To request the information on any mail group, send an e-mail message to listserv@tapr.org and in the message text include:

information listname (where listname is the name of the mail group)

When you are ready to subscribe, send e-mail to listserv@tapr.org with the following command in the message text:

subscribe <list> <your name>

List should be the name of the mail list you want to join and Your Name should be both your First and Last Name.

Current SIGs include:
NETSIG Regional Networking SIG
BBSSIG BBS SIG
HFSIG SIG on HF Digital Topics
DSP-93 SIG for those that are building TAPR/AMSAT DSP-93 kits
APRSSIG SIG on APRS

FTP users

The TAPR Software Library is now available via anonymous FTP. You can access the library by ftp access to 'ftp.tapr.org' in the directory /tapr. Login in as 'anonymous', with a password of 'your_account@internet_address'.

Packet Raido and TAPR is on the World-Wide-Web!

The series is accesible through the Packet Radio Home Page at this URL:
http://www.tapr.org/tapr

What's here? A page of links (the Home Page), the TAPR Home Page, a page of Packet Pioneers and Contacts, a hypertext packet primer and FAQ, and more.

Thanks to Howie, N2WX, for his support and invaluable contributions of
the TAPR page.

```
Tucson Amateur Packet Radio
------------------------------------------------------------------------
TAPR 1995 Annual Meeting to be held in St Louis
------------------------------------------------------------------------

TAPR 1995 Annual Meeting * March 3, 4, & 5 * St. Louis, Mo

Join some of the brightest and most enthusiastic of today's packet
developers/users, with a weekend full of Packet Radio and Digital
Communications talks, presentations, SIG meetings, and two SPECIAL
Sunday Workshops. In addition, an advanced DSP symposium is being held
on Friday, March 3rd.

TAPR 1995 Annual Meeting
------------------------
TAPR's annual meeting will be co-hosted by MoAmPS (Missouri Amateur
Packet Society) on March 3rd, 4th, and 5th, 1995, in St Louis, Mo. TAPR
(Tucson Amateur Packet Radio), a non-profit research and development
corporation, works on the advancement of digital communications and
education. This year's annual meeting will be the first held outside of
Arizona and presents a unique opportunity for those unable to travel to
Tucson to attend meetings.

The annual meeting informally begins Friday afternoon with the opening
of the hospitality suite and continues later that evening with dinner.
Dinner is always low-key and provides a great opportunity for those who
arrive Friday to discuss and chat about projects before the rest of the
weekend begins. Friday evening, after dinner, the Regional Networkers
Special Interest Group will met.

An advanced DSP symposium will be held Friday, March 3rd starting at
3pm, through dinner (which will be provided), and concluding sometime
that evening. The purpose of the Friday symposium is to bring
developers of DSP technology together to discuss future directions and
technology. The DSP symposium will be conducted by Jon Bloom, KE3Z.

The annual meeting formally begins Saturday morning with presentations
and papers, as well as discussion on other projects of interest
throughout the day. Issues concerning packet networking and BBS
operation are also anticipated. Lunch will be up to the participant
this year. Facilities at the College will be available to cater
individual tastes. Dinner will be held after the Saturday afternoon
session and will include a prize drawing. After dinner, Special
Interest Groups will meet and discuss issues.
```

On Sunday, two workshops will be held. One will focus on Error Correction Techniques, by Phil Karn, KA9Q, while the second will focus on higher level interests for the development of hardware/software for the TAPR/AMSAT DSP-93, by Bob Stricklin, N5BRG.

These are exciting times for digital communications and TAPR. This year's meeting should be a super-charging event for everyone who can attend!

Meeting Place and Hotel

The TAPR Annual Meeting presentations, meetings, and workshops, will be held at the St. Louis Community College at Florissant Valley. Lodging will be at the Henry VIII Hotel and Conference Center, 4690 North Lindberg Blvd, St. Louis (Bridgeton), MO, 63044, Phone (lots of them): 800-325-1588, 800-392-1660 (in MO. only), 314 731-3040, or FAX 314 731-4210. Rooms rates are $58 for single or double or $68 will get you a "suite" for single or double. The hotel has a coffee shop and nice restaurant, with another restaurant/bar next to it (in same parking lot). It is approximately 4 miles west of St Louis Lambert Airport with shuttle service and approximately 10 miles book your room prior to Feb 4th, 1994.

Annual Meeting Registration Costs

(without dinner) (with dinner)
Pre-Registration (before Feb 17th) $15.00 * $25.00 **
Late Registration or at door $20.00 * $30.00 **

* Annual Meeting Registration includes:
A copy of the TAPR 1995 Proceedings
Lunch is not included this year.
The College provides food facilities.

** TAPR Dinner Saturday evening (limited space),
Prize Drawing, Speaker (TBD)

DSP Developers Symposium, Friday

3pm. Conducted by Jon Bloom, KE3Z

Pre-Registration (before Feb 17th) $10.00
Late Registration or at door $15.00

Error Correction Techniques, Half-Day Workshop, Sunday

8:30am - 11:30am. Phil Karn, KA9Q

Pre-Registration (before Feb 17th) $10.00
Late Registration or at door $15.00

TAPR/AMSAT DSP-93, Half-Day Workshop, Sunday

12noon - 3:00pm. Bob Stricklin, N5BRG

777. Poor FTP performance @ 9600 baud ...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-19 03:34:58 UTC
From: Alan Bradley <abradley@freud.inst.com>
Message-ID: <3i6e92$s4d@freud.inst.com>
Source record: 44758

Was wondering what other tcp/ip users are using for MTU, TCP MSS, TCP WINDOW etc. I have just recently upgraded to 9600 baud, and am quite disappointed in the poor download times for a FTP. I am currently using the same values as I was on 1200 baud. They are:

```
attach asy 0x2f8 3 ax25 tnc97 4096 512 19200
tcp mss 472
tcp window 1888
```

Also was wondering if the 'tcp maxwait' command will help wake-up an ftp session that has been slowed to a halt.

Thanks

First the good news: the 450 is an outstanding radio for the digital modes!

I run its "middle brother" the TS850 (I guess the 950 is the "big brother" ..)

I am more familiar with the 850 than the 450, but in essence the two radios
are very much the same with respect to their capabilities on digital. My
suggestions:

1) The 500 Hz filters are the best filters for amtor, pactor or rtty. This
filter makes a tremendous difference over the stock 2.7 KHz filter.

2) To take advantage of this, you need to wire up your 450 for FSK rather
than AFSK. Since this is done differently for the 450 than the 850, I can't
tell you how to do it, but I know others have done it. Probably someone on
the net can help you out.

3) By wiring for FSK, that causes the bandpass for receive to shift such that
the filters operate optimally for digital. You will notice that QRN and hiss is
higher pitched than on SSB. This happens when you switch to FSK mode.

(I haven't done this on a 450, but that's how the 850 is, and I'm told by
others that the 450 is the same.)

Your TNC manual or mfg. should be able to tell you how to wire up your
450 to the TNC for FSK mode.

DSP filters are nice. However, these are audio filters. This means that they are filtering signals outside of the IF. Accordingly, even a signal being filtered out by an outboard DSP filter will activate AGC action, which can lower the RF gain on the (possibly weaker) signal you are listening to. On the other hand, the 500 Hz IF filter integral to your radio is ahead of the AGC circuit, and will not allow this problem to occur.

Hope this helped.

I'm not too worried about someone forging a post under my name - I operate on one system, only, and if it didn't come from there, it's going to be pretty easily shown that it's not mine. Regardless, a SYSOP that doesn't look at the activity on his box is asking for trouble - if you're passing so much traffic that you can't keep track of it, perhaps you might wanna remind yourself of the rules regarding third-party traffic. At the very least, if each sysop takes care of traffic originating on his box, then the problems don't occur. Unfortunately, that's not being done, now, and so there are pieces of traffic that are inappropriate, and according to the regulations in this country, illegal for transmission over amateur radio.

RE: KPC-3 and WEFAX

If you want to buy a program I believe Interflex Systems may sell one
(it is not one they wrote) for about $50. Be advised that you will not
get grey scale with the KPC-3.
If you really want good sat pix I like PC HF FAX from SSC which retails
for about $100 and includes software, hardware, cables, etc.

785. Wanted: Host mode equivalents to these PK-88 commands

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-20 21:54:00 UTC
From: "Steven V. Christensen" <chrissv@cat.com>
Message-ID: <3ib31o$iqb@agate.berkeley.edu>
Source record: 44766

Hello,

I have a copy of the PK-232 tech ref pages which describe the PK-232
commands and their host mode equivalents. For the most part, most of the
PK-88 commands (I have a PK-88) are listed there too, EXCEPT the following:

ACKPRIOR AFILTER AUDELAY CONOK
DIGIPEAT MAILDROP MBELL MDMON
MID MPROTO TONE WHYNOT

Does anyone know the host mode equivalent (2 characters) for the above
commands?

Thanks,

Steven

Source record: 44767

I am planning to setup a high-profile node in Northeastern Bartholomew
County, Indiana. The situation which the node will be in doesn't
encourage the use of a computer. I've found the G8BPQ software, but
the computer must be running to keep the node up.
What I need is a location to get programmed EPROMs for NetRom or TheNet

I currently have an extra KPC-3 that I would like to put at the node,
but I have never heard of EPROMs for the KPC-3.

Any assistance is appreciated.
TNX & 73,
Brian, WW9A

787. Hostmode, what is it?

Newsgroup: rec.radio.amateur.digital.misc

Can anyone tell me:-

1. What is hostmode? What kind of features and possibilities
does it provide over regular modes?

2. Is hostmode found in TAPR 1.1.8a for TNC2?

3. Where can I find out more info about hostmode?

Look at the "MOnitor" command description in the manual. You can fully monitor (in HEX if you like!) all packets and all HF modes without being connected or specifically called. You can continue to monitor a packet channel, even if you are connected on that channel ("MCONnected") command.

If you have a PC, I'd strongly encourage you to consider Kantronics HostMaster II.

There is a paper on it in either the third or fourth ARRL CNC papers.
(I forget which offhand, but the first four are sold as one volume
by the ARRL...)

This paper can also be found with the source code for SoftKISS which
you should be able to find on ftp.ucsd.edu

796. Can Kantronics KPC-3 work with dumb terminal?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-21 20:52:57 UTC
From: "F. Kevin Feeney" <fkf1@cornell.edu>
Message-ID: <3idjr9$15j@newsstand.cit.cornell.edu>
Source record: 44778

A friend of mine just picked up a used/like new KPC-3 tnc with plans to use it with
a dumb terminal initially and a computer shortly. He says that in the manual it refers only
to use with a proprietary terminal program that is presumably shipped with the unit, but
didn't come with his. I have not had hands on it - but I'm having a hard time imagining that
it would *have* to work with a PC in some sort of host mode. Is he misreading the manual?
Or does the KPC-3 really need to work with only it's own software. Tell me it ain't so....

Try BURBNK to (NYHUB, LIHUB or any of about 6 digis in the NYC area).
KF4HH and I used it for live coast-to coast HT to HT, Keyboard to
Keyboard connects until my local node became virtually stand-alone.

>
> HELP!!!

It is a dumb terminal. And slow too. At 1200 baud, the display gets over ran. In effect the bits get lost at the display, not in the serial port. It works fine as long as you read "short" (i,e, 1 or 2 line) messages. To solve the problem, set the baud rate between the Model 100 and the PK-232 to 600 baud. (Or 300 if you can't do 600). Doing t his and reading long things (like bbs political messages) will scroll nicely without missing chunks. However, you will be sending RNR frames back to the bbs as you fill the buffer up in the PK-232. (Which won't be a problem unless you are downloading huge things like manuals and such.)

Jeff

thayes@posidonius.rutgers.edu (Tim Hayes) wrote:
>
> Does anybody know if an AX.25 driver for MacTCP exists?
>
Tim:

I wish you luck on your project. I have considered paying one
of the Mac programmers at work to do it (my C is horrible) and
I actually played with KISS off of a hypercard stack (it sucked).

I've hacked an AX.25 driver but it's written in Apple CommonLisp and not
in C. I've been threatening to rewrite it in C++ (or maybe vanilla C),
so it would have decent enough performance on a MacPlus to act as a minor
server of some sorts. But i'm not convinced yet that most of that time
is being spent inside of either SoftKISS or the trace output stream. ACL
may be great for R&D, but another language is better for production or
distribution.

I thought NET/Mac has some option to talk TCP to the MacOS, but it's been
i long time since i've looked at that, and since i wanted a much richer
environment to experiment in, i took the time-honored homebrew path.

Since we have over 20,000 Macs on our network (we are told we
are the 2nd largest Mac network) I have a close relationship
with Apple (We have reps on-site and are a campus of Apple's
Developer University). Accordingly, if you need any info about
the internals, just let me know.

Getting an AX.25 driver to just pass TCP packets to the Mac O/S doesn't
seem all that hard to me, given support in terms of internals, since TCP
is just encapsulated in UI packets, which are not subject to flow control
or acknowledgement. The hard part (IMO) of getting AX.25 working is
handling those details well in a congested RF enviroment. Trying to
make anything packet-related work at 1200 bps or even 9600 bps, and to
provide anything close to real-time interactiveness on a non-empty
channel is a challenge at best...

If you (plural) have got an RF modem, then this would definitely be
worth doing. But at less than 10Kbps, it would be basically a toy or
a demo of what might be possible if we could do something about net
bandwidth [pun intended]. The problem is that with much contention
on the channel, in my area, this can be a factor of 5-10 less than
the raw bit-rate,and that's alot worse than what we put up with 10-20
years ago on dialups in the computer world. In that case, i believe
TCP has just too much overhead, and AX.25 still runs pretty slow.

-- KD6PAG (a networking old-timer, who'd be quarter
century if it hadn't been for the code)

803. Question about BPQ Setup

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-23 01:16:21 UTC
From: robver@bart.nl
Message-ID: <3ig66g$i08@aladdin.rotterdam.luna.net>

; to think about a suitable value. Max is 255

BUFFERS=100 ; PACKET BUFFERS - 255 MEANS ALLOCATE AS MANY
; AS POSSIBLE - NORMALLY ABOUT 130, DEPENDING
; ON OTHER TABLE SIZES
;
; TNC DEFAULT PARAMS
;
PACLEN=128 ; MAX PACKET SIZE
;
; PACLEN is a problem! The ideal size depends on the link(s) over
; which a packet will be sent. For a session involving another node,
; we have no idea what is at the far end. Ideally each node should have
; the capability to combine and then refragment messages to suit each
; link segment - maybe when there are more of my nodes about than 'real'
; ones, i'll do it. When the node is accessed directly, things are a
; bit easier, as we know at least something about the link. So, from
; Version 3.11 onwards, there are two PACLEN params, one here and
; one in the PORTS section. This one is used to set the initial value
; for sessions via other nodes, and for sessions initiated from here.
; The other is used for incoming direct (Level 2) sessions. In all cases
; the TNC PACLEN command can be used to override the defaults.
;
; The main reason for changing this now was a request from someone
; wanting to run an HF port.
;
;
;
TRANSDELAY=1 ; TRANSPARENT MODE SEND DELAY - 1 SEC
;
; Level 2 Parameters
;
; T1, T2 and N2 are now int the PORTS section
;
T3=180 ; LINK VALIDATION TIMER (3 MINS)
;
IDLETIME=900 ; IDLE LINK SHUTDOWN TIMER (15 MINS)
;
;
; Configuration Options
;
BBS=0 ; INCLUDE BBS SUPPORT
NODE=1 ; INCLUDE SWITCH SUPPORT
;
HIDENODES=0 ; IF SET TO 1, NODES STARTING WITH # WILL
; ONLY BE DISPLAYED BY A NODES * COMMAND
;
; THE *** LINKED COMMAND IS INTENDED FOR USE BY GATEWAY SOFTWARE, AND
```

```
; CONCERN HAS BEEN EXPRESSED THAT IT COULD BE MISUSED. I RECOMMEND THAT

;
; These define the external links - normally to radios, but possibly
; to other computers, modems, etc.
;
; The hardware type and protocol are now defined separately, but
; at the moment only a limited number of combinations are possible
;
; Interrupt levels may be shared by any cards with suitable
; hardware. Examples are all but the earliest DRSI cards, and
; a MS400 modified as described by AA4RE in his MBBIOS documentation.
```

```
;
; There is a significant overhead in using the shared interrupt
; feature - try to use it on relatively low speed links, and
; wath out for TX underruns/RX overuns.
;
;
; See file PORTS.DOC for full details of available paramters.
;
; Note that all timer values are in ms intervals. Most TNC's
; use different units for the various timers, so be careful!
;
; The timings are all derived from the PC's timer interrupt,
; who's frequency is about 18.2 HZ, so the resolution is only to
; approx 50ms.

805. Radio Interface Card for 486 PC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-23 19:00:23 UTC
From: dbrennen@ix.netcom.com
Message-ID: <3iim07$9te@ixnews1.ix.netcom.com>
Source record: 44788

I'm building an interface card for an IBM 486 as a school project. The card would be a radio frequency tuner that would be controlled by a window on the display. I want to include to standard FM Stations, but I would also like it to tune 1 or 2 more bands that would be of interest to an average PC user. What I need are suggestions on bands to include, which electronically tunable chips to select, and any other ideas on ways to make this project work.

806. Any users of TAPR 9600 bps FULL DUPLEX modems?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-23 19:49:07 UTC
From: jdonimi@nv2.uswnvg.com
Message-ID: <3iiorj$9mh@fred.uswnvg.com>
Source record: 44789

Hi,

In the Seattle area there is a 4 node TCP/IP data network working on 2 meters (simplex) and 440 MHz (full duplex). We are experiencing strange problems with our TAPR 9600 bps modems. There are 3 specific issues:

1. The Modem is hard of hearing. Using identical Motorola Pulsar (full duplex) radios, the TAPR cannot hear my 30 watt station but I can decode every packet it sends with its 10 watt transmitter. We measured the RF desense at 1 dB or less at each of 3 sites and all are hard of hearing. I use a Paccom 9600 TNC at home. We added an LNA to the TAPR site radio to boost sensitivity by 9 dB. Now there is 14 dB more signal entering the radio with the TAPR modem than the other way and it still doesn't hear well.

2. The bit regenerator on one of the three TAPR setups is wierd. It keys the transmitter whenever a signal is received, but retransmits garbage which no TNC can decode (regardless of brand). We even tried 2 second TX delays with no success. One day, I touched pin 12 of U1 with a scope probe and it worked as long as I kept the probe in place. A new U1 chip did the same, so I soldered a 100 pF cap from pin 12 to ground and the bit regen has been working ever since. TAPR hasn't had the time to look into the problem since we wrote them in December. Anyone else see this problem?

3. Lockups. Periodically the TNC, running KISS code, will lock up and has to be reset with a power off-on sequence. It happens so often we had to devise watchdog timers to power cycle the TNC if the PTT lines quits working.

Has anyone else implemented a full duplex TAPR 9600 based repeater/node? If so, have you seen any of these symptoms? I can be reached at:
jdonimi@uswnvg.com
and I'd love to hear from persons with full duplex experience at 9600 bps.

Jeremy WA7YGB

Any TNC will work with a DUMB terminal program. What you really lose are
the features that having a full featured HOST program provided.
Multiple connects in separate windows, log support, file transfers
etc etc.....

Actually, the book doesn't explain KISS mode much at all, except how it works with NOS. The book doesn't explain any about the inner workings of KISS mode, but rather is meant as an introduction for someone getting into TCP/IP.

>
>Can I change the crystal in the DM-1 to "retune" it - at the expense of
>probably having to have 2 crystals - one for 2m and one for 70cm ?

The DM-1 uses a 74 MHz xtal for operation in the 3 amateur bands. The
74 MHz x 2 = 148.000 MHz, 74 x 3 = 222.000 and 74 x 6 = 444.000. You might be able to
get the unit to operate on other frequencies, but remember the main oscilliator is
expecting a
frequency of about 74 MHz to be used.

IT AIN'T SO!

Hope that helped.. Just use any terminal program. Pcplus, Telix, whatever.
Set it to the com port and baud rate you have the tnc set at. Or set it
at the baud rate you want it to be at if you are going to do an autobaud
ruotine with the kpc-3. And just type away.. Use telix all the time..
73..

819. How to get started in RTTY?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-24 21:43:58 UTC
From: usul@mcl.ucsb.edu
Message-ID: <3iljuu$29f@ucsbuxb.ucsb.edu>
Source record: 44701

I just got a Pro-51 scanner, and I hear a lot of traffic that I suspect
is RTTY. Naturally, being an aspiring SIGINT boy, I'd like to monitor it.
Is the scanner I have (hand-held, with an output jack) capable of
reliably receiving RTTY traffic?

If so, I assume there's the radio radio equivalent of a modem that
I'd plug into the headphone jack. The modem, then gets plugged into
one of my computers. (I have a Mac and a PC available.)

Is this feasible? If so, what equipment/software do I need to get?
For what it's worth, I intend to set up an all-band base station
antenna to replace the rubber ducky the scanner came with.

Sorry if this is a faq, and I appreciate any help.

>From this, I'm not sure if you are asking about any specific host mode variant or not, so I'm going to hit the host mode protocol that I know, i.e., the Kantronics host mode. My apologies if my reply is not what you were after. There are a number of different implementations of ``host mode'', and I'm really not sure how similar they really are. From this point on, I'm referring specifically to the Kantronics host mode, but some/all of this may apply to others as well.

Background: I'm the author of a shareware (for dos) host mode terminal program for Kantronics TNCs, called KAMterm (originally named as such because I was writing it to use with my KAM <grin>).

Anyways, the short version is this: I wrote KAMterm because I wanted features that were only available via host mode, and at the same time, I wanted some features that I'd never seen implemented anywhere else. It really does offer a lot of nice capabilities, and frankly, once you get used to it, it's hard to go back to a dumb terminal...and I should know---I haven't ported KAMterm to UNIX yet, and I rarely reboot under dos to use the TNC. (I am considering the possibility of hacking up the terminal program I use under Linux, minicom, to work with host mode, but that is just barely in the planning stages right now.... If that really happens, it will be freeware, just like minicom already is.)

The Kantronics host mode interface protocol is basically a simple, framed format for communications between the computer and the TNC. Instead of a plain dumb terminal interface, all data between the computer (DTE) and TNC are addressed by the specific port/stream, and the type of data in the block (e.g., command, data to be transmitted, etc.).

As for the features you can get via host mode, the following is the Preface to the KAMterm documentation, which covers this very point:

---------- CUT HERE ----------

KAMterm: Copyright 1992--1995 by Jim Graham, N5IAL (All Rights Reserved)

PREFACE

As part of their more recent firmware in their TNCs, Kantronics offers a special mode of operation known as Host Mode. Host Mode differs from the ``normal'' operating mode in many respects, and offers a great deal of additional capabilities when using Host Mode terminal software.

This section is a general introduction to what Host Mode is and how it operates, what it buys you, and some special considerations for using Host Mode as opposed to the normal command mode.

What Is Host Mode?

Before going into any detail on the benefits of using Host Mode, it is important to first have a general idea of what Host Mode actually is, and how it operates, as opposed to the normal command mode you are probably more accustomed to using. It is not necessary that you fully understand the details behind this, but you should have somewhat of a feel for what's going on behind the scenes. The detailed description of the data format is in the Kantronics documentation, and only a general summary will be listed here.

In normal command mode on TNCs, the text you type is transmitted directly to the TNC exactly as you typed it. This does not require any special software on your computer other than a simple dumb terminal emulator. In fact, in normal command mode, you can attach a plain terminal (as opposed to a computer running terminal emulation software) to the TNC.

In Host Mode, however, the text you type is not transferred to the TNC directly. It is first enclosed in blocks of data, which include a header indicating the type of data being transmitted (commands, data to be transmitted, etc.) and the port and stream to which the data is addressed, and a flag marking the end of the data block.

WHEN THE TNC IS IN HOST MODE, A SIMPLE TERMINAL EMULATOR WILL NOT BE ABLE TO COMMUNICATE WITH THE TNC DIRECTLY, AS IT WILL NOT PUT THE DATA IN THE REQUIRED DATA BLOCKS. Likewise, when the TNC is in normal command mode, software attempting to run Host Mode communications to the TNC will also fail to function.

The data format used within Host Mode is actually very simple when compared to that used in other data communications protocols (such as X.25, AX.25, TCP/IP, etc.). The blocks of data are delimited by a flag, called a FEND (C0H, or decimal 192). In most types of data blocks, the first FEND is followed by 3 characters, indicating the type of block, the port, and the stream, respectively. This is followed by the actual data, and finally another FEND which signals the end of the block.

What Does Host Mode Buy You?

First, you can (assuming you have the KAM, as opposed to the KPC, etc.) operate in a non-packet mode on HF, while operating packet on VHF. (Without Host Mode, attempting to operate non-packet modes on HF while connected on VHF packet will get you a ``NOT WHILE CONNECTED'' response

from the KAM.)

In addition, regardless of the type of Kantronics TNC, the special block format of Host Mode allows you to do many things in Host Mode that can not be done in normal command mode.

For example, in normal command mode, all data, regardless of the port/stream it is from, is simply dumped to your screen, and each time you wish to change streams, you must issue a command to the TNC to change it to the new stream.

In Host Mode, however, the data block identifies the stream from which incoming data is arriving, which provides for the design of a windowed environment, such as KAMterm. In such an environment, the data for each stream can be given its own window, thus keeping things cleaner on the screen. In KAMterm, you need not keep telling the TNC which stream you wish to work with---the Host Mode data format takes care of this for you. Outgoing data is automatically set to the port/stream associated with the window you are currently viewing.

A related feature is the ability to have an entirely separate screen for command entry (same as you would have with the TNC at the cmd: prompt) and for monitor output, once again keeping the screen much more organized.

All of this boils down to being able to have multiple connections open, with a different screen for everything. To change from one conversation to another, you simply move to the next screen and the software takes care of the rest for you automatically.

There are other features derived from this in KAMterm, such as the ability to keep an eye on one stream while in another stream's window, the AMTOR XMITECHO window (which displays the text as it is transmitted without interfering with other operations). These and other features will be described in more detail later.

Special Considerations When Using Host Mode

In general, Host Mode can make things much simpler for you, but there are a few things you need to keep in mind, or you may find yourself in some confusing situations.

First, and most important, if the TNC is set to use normal command mode, and the software is trying to use Host Mode (or vice-versa), neither one will recognize the other. While you are in KAMterm, if you change between Host Mode and normal command mode, KAMterm will take care of changing the TNC's setting for you. If you also run other terminal software, however, it is important to keep this in mind when configuring and using KAMterm.

In general, if you expect to use any other terminal program, possibly including other Host Mode software, you should configure KAMterm *NOT* to automatically start and exit in Host Mode. This is, therefore,

the default configuration.

For example, if you exit from KAMterm and leave the TNC in Host Mode, and then try to use a plain terminal program, it simply will not work, because the TNC is expecting Host Mode data blocks, and the terminal program is not providing them. To prevent this situation, do not leave the TNC in Host Mode if you expect to use a regular terminal program.

Similarly, if you have instructed KAMterm to immediately start off in Host Mode (see the section on the configuration file for details), and the TNC is in normal command mode, KAMterm will be presenting Host Mode data to the TNC, and the TNC will not recognize the data format. You can re-establish communications with the TNC by telling KAMterm to return to normal mode.

NOTE: It has come to my attention that the HostMaster software from Kantronics automatically returns the TNC to normal command mode when it exits, so if you use KAMterm after using HostMaster, do not assume that the TNC is in Host Mode---it probably isn't.

A second thing to keep in mind is the fact that the command screen is always associated with some port/stream combination. If you are connected on streams A, B, and C on the VHF port, and you wish to disconnect stream C (using the DISCONNECT command), you would return to the command screen and enter that command. You must, however, make sure that the command screen is pointing to VHF Stream C, or you might end up disconnecting the wrong stream! The status bar will always indicate the port/stream associated with each window.

A third thing to keep in mind is the fact that when you make a connection from the command screen, you will see a status message informing you of the connect, but from that point on, all data from that connection will be displayed on a different screen. This differs from what you would expect when using normal command mode, where the data from the connect is dumped straight to the same screen (the only screen).

--------------------------- CUT HERE ---------------------------

If you have any questions about the Kantronics host mode, KAMterm, etc., please e-mail me and I'll be glad to answer anything I can.

Later,

Thanks for looking in. I'm trying to get some info for my dad.
Gunde Frostrup Lives In Bella Coola, BC, Canada. He's VE7 TNN.
The idea here is to set up an Internet acount that can be accessed
via radio rather than long distance telephone. Can someone recommend
a good server and software for hams?
He's got lots of gear. Just needs hook up know-how.
If you can help out I'll relay the info.
Thanks,
Karl

you want a multimode data controller or multimode terminal node controller.
see mags like QST for ads by the manufacturers for the latest things..not all
the stuff you hear is really as simple as rtty, but for the stuff in use
in the amateur market, decoders are available (even almost all software ones).

>incoming data when wiring up the accessory port of my Icom 765 for HF.
>What pins need to be wired to transmit cw, packet etc through accessory
>port in rear of receiver? TNX Ron KM4VX 73.

Ron,

The IC-765 ACC 1 port wiring for packet is as follows:

ICOM 765 ACC 1 KAM

Pin 1-FSK input FSK keying lead
Pin 2- Ground Ground lead
Pin 3- PTT PTT lead
Pin 4- AFSK input AFSK output lead
Pin 5- Receive audio Receive audio lead

The impedance of Pin 4 on the 765 is 10,000 ohms and requires about 100 millivolts to drive the radio. The impedance of Pin 5 is 4700 ohms and will provide between 100 to 300 milli volts fixed level output. My suggestion is to use FSK where possiable as all modes except for Clover will operate fine using FSK. If you choose to use FSK, then DO NOT attach the lead to Pin 4 as you will open the radio for RFI input on the high impedance Pin 4 should you decide to also use SSB phone. Pin 4 never gets disconnected when using the mic, but the data switch will disconnect the mic when using the rear ACC 1 input. I hope this helps.

Gary Fiber

827. BPQ and AXIP, ethernet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-26 06:22:24 UTC
From: jmorriso@bogomips.ee.ubc.ca
Message-ID: <1995Feb26.062224.28576@bogomips.ee.ubc.ca>
Source record: 44709

I noticed the BPQ software supports connecting switches over ethernet.
However it uses some made up protocol number in the ethernet header.
Not IP, not IPX. This strikes me as completely useless because there's
no way that this is compatible with any routers, you'd need an
ethernet bridge to communicate with other stations that aren't on your
ethernet. BPQ has some TCP/IP support, it couldn't be too hard to add
support for AXIP which is at least a *standard* way to encapsulate
AX25 packets, and use IP which is at least a routable protocol. Anyone
know where to email G8BPQ? Since there's no way to modift BPQ (no source
code!!) the only workaround would be adding support in NOS or maybe
Linux, anyone actually try this?

From: dhinch@cello.gina.calstate.edu
Message-ID: <3iq62r$riq@cello.gina.calstate.edu>
Source record: 44710

I am looking for a new dual band mobile rig which will also do 9600 baud packet. In analyzing the available models, I find that the 733 is the only one that is set up for 9600 baud. The 733 also appears to have a good range of other features and claims to have addressed the issue of intermod with AIP. Does anyone have any comments on this rig or have recommendations concerning another? I need to act pretty soon as there is a Kenwood coupon deal that expires in a couple of weeks.

Thanks in advance.

spring for a repeater directory, under $10 everywhere...

start scanning the band from 146.61 to 147.39 MHz. odds are you'll hear
something in there (esp. around drive time).

the flexible antenna will probably do initially. set the radio next to a
window and try a couple of other places until you find some activity.

838. Can I have an Internet link in a ham band?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-27 17:05:21 UTC
From: darrick@ncc.com
Message-ID: <3it0oi$b7f@news.onramp.net>
Source record: 44719
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.policy,rec.radio.amateur.misc

I live about 25 miles from my job, out in the country. At work, we have a 128Kbps ISDN line coming in to our TCP/IP network. I spoke with my boss and he had no problem letting me connect to the net from home on a 24 hour a day basis. The problem is, where I live the phone company doesn't supply ISDN. I don't want a slow 14.4kbps link (I'm too used to the nice, fast connection at work :-)), so a regular phone line is out (plus, the phone company charges me extra just for a regular phone line!). Well...

Can I set up a WA4DSY 56kbps modem on both ends, and set up a 24 hour a day, 7 day a week internet connection for myself? This is mainly for personal reasons, although that doesn't mean I won't check on things at work from home (I'm a network coordinator at work), or download some files for work at home on the weekends, but probably 95% of everything done on that link would be for my personal enjoyment. I was thinking of using the 10gHz band for this link.

Does the FCC allow this type of transmission? Can I do it, but with restrictions? If so, what are they? If there are no restrictions, please tell me. If this is a FAQ, please excuse me. Email me if this is of no interest to others in this newsgroup. *** Followup to rec.radio.amateur.misc. ***

Thanks in advance.

839. Microwave Communications

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-02-27 18:45:53 UTC
From: towen@freenet.vcu.edu
Message-ID: <3it6l1$7sh@freenet.vcu.edu>
Source record: 44720

I'm new when it comes to microwave communications, although I have read many of the ARRL books on the topic. I live in Richmond, Virginia far from any mountaintopping. I am interested in what I can do with microwaves.

Without a line-of-sight line, how far can I transmit? (I know there is no one answer to this question.) I am interested in 3.4, 5.7 and 10GHz on SSB and FM (ATV in the future). What would it take for me to reliably make EME contacts? dish size, transmitter power, etc.? Could I reliably use troposcopic scatter on these frequencies to contact Washington, D.C. (70 miles) or Baltimore (130 miles)? Is one band better/worse than another?

I know that most 10GHz work is with Gunnplexers, around 100 to 250mW, can I amplfy this power? The 3.4 and 5.7GHz bands seem to use transverters to 1.3GHz and then to 144MHz for SSB, any suggestions? What kind of performance/distance can I expect from non-mountaintop microwave communications, before I invest a few thousand dollars?

Any help would be appreciated. How about a rec.radio.mwave subtopic?

I would say that if the things you are doing for work are part of your
ordinary job and not directly related to an emergency threatening the
life or safety of person or property that you'd have a pecuniary interest
in the communications. In other words, the communication link is allowing
you to perform work over the amateur bands. That would be illegal. So
in your above scenario, you'd be legal 95% of the time. ;-)

It would be similar to a pizza place setting up an order line on 2 meters.
The FCC has already said specifically that such transmissions are
illegal.

The restrictions are on content, not method. You can easily set up the kind
of link you described in the band you desired. But you can't conduct work
over that link.

Darin,
You can obviously accomplish this, however you are going to have to
limit your use to strictly amateur radio relation. The other thing you
will have to be certain that it has a firewall to keep out the unwanted.
This would be literally the same as the Internet Wormholes that are in
existance today. Logging into your e-mail account at work via the radio
would be illegal if you were intending to use it to pull down your
company related info. IF it were strictly for NON-Business third-party,
you would probably want to set up the computer tied to the radio with
an SMTP connection for mail transfer. There are lots you can do, but
there are of course limitations.

From: drin@concerto.valrho.cea.fr
Message-ID: <drin-2802950810500001@193.48.14.32>
Source record: 44727

We (F6EPE, F1UNA, F5SYM, F5HFZ) were trying to start packet on 9600 in
the south of FRANCE. We use PAR 9600 + BAYCOM 1.6 the TX/RX are TS 732 or
733 from Kenwood.
It works on RX (ie we get the trafic from satellite) but nothings on
TX.It seems very hard to adjust the filters and the different levels.

Some help will be very appreciated.
Is there any other soft for the PAR 9600.

Best 73
Nic.

847. 9600+ modems?

Newsgroup: rec.radio.amateur.digital.misc

Agreed - for all modes; however, for just genuine RTTY, you need a terminal
unit - basically some tuned filters and a +/-80 (I think) volt driver - and an
old teleprinter machine; these used to be available for a song, and are a
fascinating example of purely mechanical coding! (Be warned - they are VERY
noisy!) Or, a T. U. and a Baudot-to-ASCII conversion prog. for your computer.

>Being a newbie (actually, not even having a ham license I'm not even worthy to
>use newbie in a sentence) I have many questions. First of all, why do the data
>comm people limit themselves this way ? Typically voice requires very little
>bandwidth but for longer periods than data, which requires wide bandwidths for
>very short periods.
>Is it a governmental/beurocratic regulation ?

Too an extent. On 2 meters, there's a bandwidth restriction of 20 kHz, which
happens to be what you get with 1200 baud AFSK over an FM voice transmitter.
However, with a pure FSK transmitter, you can do better, up to around 9600
baud (and a FM transmitter can be made to work as a FSK transmitter with some
slight modifications). Above 2 meters, wider bandwidths are allowed, and
greater speeds are possible.

>Is it because typically people use the same transmitters they use to transmit
>voice ?

BINGO! This is the main reason. Without training sequences, the voice
bandwidth of FM rigs used with AFSK is only sufficient for about 2400 baud,
4800 on a good day. To get even to 9600 baud requires some rig modifications
for direct FSK that a lot of people won't do. For speeds above 9600, you
really need to scrap the voice radio paradigm and go to a true RF modem.
The GRAPES 56 kb RF modem is an example of that. It *is* the radio as
well as the modem. It uses MSK modulation, so it's relatively bandwidth
efficient. But it's only offered as a kit, and appliance ops don't
want to build. Kantronics offers a 19.2 kb FSK system already wired, and
some people have gone that way.

>Is it because it would be unfair to gobble up a larger portion of the spectrum
>(even though its for a shorter period of time) ?

There are 100 kHz channels set aside in the 222 MHz and 70 cm bands
for higher speed packet. And the bands above them are empty enough
that much wider bandwidths can be supported without conflicts with
other uses of the bands. Of course all this requires some effort on

the part of those who wish to do high speed. There aren't any appliance solutions.

Message-ID: <199503010239.SAA23002@netcomsv.netcom.com>
Source record: 44656

Looking for Conference Bridge Software

I am interested in occasionally running a conference bridge on
packet for 4 or 5 users. I have tried MSYS and JNOS, but don't want
all the unnessesary code and hardware requirments they have.
(I would like to run it on a floppy based laptop). It would also be
nice if it could work with any TNC, ie: not require host mode.

I have been unsuccessful in finding DX Cluster software, as well.
I have never used a DX cluster, and assumed it is just a networked
conference bridge. Am I wrong?

Is there any software that just takes text as it come from one stream
of the TNC and sends it out to all the others? I have already
started coding up my own version, but would be interested in seeing
other solutions. Please CC me on any replys to the newsgroup.

Thanks es 73, de KD6BCH, Byon in Orange CA. byon@quicksilver.com

From: riyadth@boi.hp.com
Message-ID: <D4qvIJ.FwC@boi.hp.com>
Source record: 44734

Hello,

while rummaging through my junk-box I came across a Zilog SCC card for the XT bus, and I am interested in putting it to use as a packet interface for my Linux PC. My problem is that it is not mentioned as a supported board by any of the SCC (Z8530) drivers I have been able to find on the net (around 4 packages/versions so far). I would like to see if anyone has heard of this card before I reverse engineer it to find out how the SCC is addressed and how the I/O port is configured.

The card is copyright 1985 by Centram Systems West, Inc., has the label "TOPS" along with a part number of 10322 Rev D Asm 201. It is a half-length XT (8-bit) card with a single Zilog SCC, an 18.432MHz crystal, and a female DB9 connector on the backk panel.

Any information leading to the identification and configuration of this board will be greatly appreciated. If drivers already exist for it, a pointer to it would be fabulous.

Thanks very much.

From: ddonovan@mayo.edu
Message-ID: <3j25j5$t66@fermat.mayo.edu>
Source record: 44677

Hello,

I am looking for some sort of list of packet to internet gateways,
I have been playing with a couple but have been fairly unsuccessful
in getting my message there then forwarded. The ones I have tried are:

W2XO@W2XO.#SWPA.PA.USA.NOAM (I think I need an alias for the internet account)
GATE@KE0WO.#NWIA.IA.USA.NA (no success lately)
GATE@WB7TPY (not sure if this site works no luck so far)

I currently live in scottsdale, Az if anyone know of one nearby, the WB7TPY station
is in phoenix, I think, perhaps I am addressing the message wrong if the station is up.

Thanks, any news would be greatly welcomed.

Hi All,

I am trying to source information about running a bbs, and having a door or similar into packet radio. To date I have no real success in finding any info on how to do this.

I have heard that it is possible, but to date don't know of any systems.
I have run a bbs in the past, and have some knowledge there, but little or no knowledge about packet radio, apart from seeing it running at the club meetin one night.

The reason I would like to do this, is to provide a gateway to club members that have phone modems and not packet ones, vis versa.

Any and all information appreciated.

870. Best NOS for beginners?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-01 20:11:47 UTC
From: ronz@zimmer.CSUFresno.EDU
Message-ID: <D4s2rn.EpM@zimmer.CSUFresno.EDU>
Source record: 44737

I see a number of different MSDOS NOS versions available for HAM
TCP/IP work and was wandering if anyone has experiances with different
ones to know what may be the easiest to get going for simple non-node
work.

I have seen: KA9Q's NOS, TNOS, WNOS, HRLNOS, and JNOS.

I looked into JNOS and find that is for unattended node operation.
Not what I want.

I have KA9Q's NOS, but have only got the dumb terminal (tip) working,
so far.

Being a new to packet and ham TCP/IP, I can use as much documentation
that I can get. Can anyone steer me to some good docs on any of the
NOS system?

Does anyone have experainces with different versions to comment on
which my be easier and most stable?

Thanks. -- RonZ, KD6E

Keywords: Need help FT290R Packet Kam MFJ-1272

Just got a FT290R for base & want to use it for occasional packet for local BBS. Got the MFJ switch so mike could be connected and Kam connected without unscrewing the mike cord (arrangement works fine on HF with FT-840 and the KAM & HF1 mike with the 1272BYH switch). With the proper jumpers (according to manual) set, the FT290R's front panel buttons fail to operate, the mike buttons on the MH-15 do not work, and the packet signal is distorted. Possibly some stray voltage issue?? Any suggestions? ANyone with packet experience on a 290R to begin with -- the manual does not mention packet?

The correct site is col.hp.com and the file you want is in
hamradio/packet/etc/firmware and is called u21_kiss.rom. It is version
1.1.5TJ for the TASCO version of the HK-21 and it seems to work fine. I
am the original poster of this thread and just made a EPROM yesterday and
it worked perfectly. Good luck.

874. packet network for multi-node network?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-02 06:48:56 UTC
From: ecarp@netcom.com
Message-ID: <ecarpD4sw9L.4wq@netcom.com>
Source record: 44647

I've been asked by a disaster services agency to recommend software for the following scenario. If anyone can help, I'd surely appreciate it...

Agency has anywhere from 6 to 50 packet radio stations, all spread out over a 30-100 mile area. Each packet station can talk to at least one other station. They want the capability to:

1. Be able to route a packet from "A" to "B" without static routing (the nodes could move around, be mobile or portable).

2. Be able to re-route around nodes which have dropped off the net, and account for nodes which appear on the net able to route messages.

The idea is for the package to be extremely flexible, and to be able to adapt to the routing requirements of the message. Source code availability is preferred, as they want to be able to run this under DOS and UNIX.

They are looking for the low level software - the message formatting software is already out there. Can anyone help, or suggest software? If I can't find it somewhere, I'll have to write it muself, and have no clue as to how to start - any suggestions? Thanks in advance...

Ron,

try the mfnos package available from the ARRL bbs or by ftp (site??).
It was very easy to set up and runs nicely. The docs are thin
but if you can find nosdoc or a similar package (like the ka9q doc
package) the basics will be there.

Can anyone help ...??

I am a General Class operator who has not been active
for a few years ..

I would like to get back in to HAM radio with Packett radio.

I would like to connect into a TCP/IP network that would
have a gateway to the internet for e-mail ...

I have a 2 meter antenna and a multi band vertical ..
I also have a Radio Shack 10 meter rig.

I need to buy a 2 meter rig .. or would it be better
to purchase a 440 rig ..??

Are there 2 meter rigs specially designed for packett ..??

How do I get a IP number for my PC ..???

I really just need a little help getting started ..

Thanks in advance ...

There is a wormhole between St Louis, Missouri and Simi Valley, CA.

This is a TheNet or BPQ node that uses a non-amateur connection for the long link. It looks like a RS-232 connection, but it's 2000 miles long.

A communications company provides the linkup, and no one asks too many questions. Is is fiber, satellite, or something else? I don't know.

Hi Ron,

Usually the best version of NOS to use it what is being used by others in your area. The main reason is that if you need a hand, you'll get the 'right' answer more quickly if you are using the same software as the person who's helping. Also if you start with a locally produced executable, it will have the right link layer and routing protocol support compiled in.

Also, JNOS is not >specificly< intended for unattended operation. I use it here at home to operate a 4-port packet router, however I also use it

for managing my local email, ftp, ax25, and finger needs.

There is an ongoing effort with most versions of NOS to increase their stability so that in situations where they are operated at sites where access is not as easy as 'going home' and hitting the reset button, that the software will be able to run for days or weeks at a time with minimal attention.

The major thrust of JNOS in specific has been to make it capable of working with conventional ax25 bbs programs to do mail and bulletin handling, as well as the tcp suite of services and as a multi-protocol router. It and TNOS have added a number of features of interest to end users, and as a result, have more active contributors, both to new features and improving existing features and stability.

Note that once you have most any version of NOS up and running, converting to another version is not difficult. Usually there are minor changes in the structure of some commands, and ofcourse there will be commands that are added and deleted based on the suite of features each development effort has focused on.

As a sidebar, almost everyone here in the Seattle area uses JNOS, tho there are certainly exceptions. We also have some folks who are using Amigas, Macs, and using the native Linux routing capabilites with ax25 support compiled right into the kernel. There are also those that are running a linux system with JNOS or TNOS for linux.

That's probably muddied the waters, but, as I said at the beginning, you'll save time and effort if you get what others are using, and it'll be even easier if you can get the configuration files that are already working for a local so you have a place to start. With the complexity of setup for NOS, editing an existing file is a lot easier than creating from scratch. Another point to consider is that in different places, the underlying network that you work with will be different. For example, in a lot of areas where IP activity is of low density, it is necessary to route IP packets via NET/ROM or TheNET nodes. In areas with higher density an IP datagram network may exist, and if so, then there are 3 major ways routing is done. Using someone elses configuration files as a starting point means you get a jump on all those issues.

Hope that helps!

73, Bob

Ok,

Thanks to those who responded re the Hostmode question.
Getting to the point of it all, I want to write software that uses
Hostmode but the source examples provided is a little confusing.
To be sure, my question is this, do we communicate with the hostmode
TNC on the BLP level or on the QAFT level? Is there an alternative
protocol definition for this level of communication? I want to know
what the TNC's sends and expects, basically.

Hi Dave

If you are not a Ham, you may not be aware of the many rules that we must follow. KE0WO is an excellent GATE, but he lays his license on the line with every message he reposts from internet to packet.

This process is done m by hand, and your message is filtered through a language filter to remove or should i say, check for bad words.

A lot of messages can be killed automatically because of a simple word like Bass Boat because if you remove the B on Bass you have a KILL WORD.

Length of the message is important also, most BBSs will kill messages over 5,000 characters, a few at 10,000.

Also cn ontent of the message must be amateur related for reposting.

Third party messages will be killed by most Gates...

Hope some of this info helps.

> Darin Arrick, KB5KHR (Advanced)

Darin's question raises two issues:

1. Can this be done technically, i.e., how well will it work, etc.?

2. Can this be done under the rules of the Amateur Radio Service?

Several respondents have dealt with the question's rules aspect, and they
pointed out the problem of the content of the link infringing on the
nature of the "amateur" service.

Leaving that issue aside for the moment, I would be interested to hear
more about the feasibility of the 56Kbps radio modem link and its technical
performance.

One respondent, drayegon@enterprise.america.com, commented that the link
performance would be poor:

"you just think your running 56 k
actually with bad packets and retries it is less than 14.4 more like 4800"

Although Ray's grammer and spelling don't lend much weight to his conclusions, I wonder if his assessment of the link's performance is correct?

If the suggested device, WA4DSY 56kbps modem, really only produces a through-put the equivalent of a 4800 bps link, it seems to be badly named.

Can anyone else comment on this? Is there a viable radio modem link that can be operated under the rules of the Amateur Radio Service that produces a truly high-speed link?

I would appreciate hearing of any equipment that can do this.

SIncerely,

Jim Hebert

> some people have gone that way.

Can you explain the impact of "training sequences" on allowing better utilization of the transmitted bandwidth? Or point to a good reference that might explain it?

Also, when you say the bandwidth is limited (be regulation) to 20 kHz, what portion of the signal must fall within the 20 kHz? All emissions? Or emissions greater than -40 dB from carrier level?

Can you explain the criterea for this measurement?

Thanks for your cogent post in response to the previous question.

Surely the problem here is not technical - it ought to be easy - but
administrative, i. e. how to stop anyone ELSE using his login? I think you'd
need a system which required a different password every time, using some sort
of encryption system - do such systems exist? Even that wouldn't prevent a
session being hijacked, but would stop a lot.

892. Will 2 mtr fm rigs run 2400 baud?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-03 15:41:53 UTC
From: dara@physics.att.com
Message-ID: <D4vFLt.84u@nntpa.cb.att.com>
Source record: 44666

I expect to start seeing 2400 packet boards on 2 mtrs. When that
happens will the typical 2 mtr fm rig be able to handle that through
the mic connector and audio circuitry or do you have to get in to
the modulator and defeat the normal voice audio circuitry?
tnx for any pointers
Shel WA2UBK dara@physics.att.com
(just poking along at 1200 baud)

I have been away for anateur radio some time, the last arrl handbook I have
is 11 years old.
a year or two ago I remember sombody saying the FCC had just opened up a band
that was for spread spectrum and was pretty much a free for all within a few
parameters like under a given wattage and >10 freq changes/sec.
does this ring a bell with anyone.

If we can find a band that will allow us to use the skills learned from
amateur radio to build equip. but use it for a slightly grey area as
far as business use or content, like usenet, that would be the ticket.

If this does ring a bell with anyone, is the power limitation amp
input, output or ERP? if it is not ERP with a good enough dish
or yagi a watt should be enough.

While we are at it looking in the handbook last night I noticed something
that evoked many an argument at the time with people I know.

several blocks of freqs, 50-54 in particular are to be used for A0 xmissions
only. Others claim this is code and A1 is FSK type code.
I say A1 is carrier on/off type code and A0 is worthless unless an amateur

radio operator needs a beacon for an amateur rocketeer's cruise missle project.
Why is such a large percentage of some bands allocated to such a useless mode? is it the feds way of giving us more space but not really?

Jim
A moderate speed link *can* operate with throughput near its raw
channel capacity. Here in Northern California, we are running several
of my radios with Ottawa PI2 cards doing clock and data recovery at
230.4 kbps. Over a single hop with 386 DX/40 hosts and running IP with
JNOS, we see as much as 18 kilobytes/sec *throughput*. This is a little
more than 60% of the raw channel capacity of 28.8 kbytes/sec. The
reduction is related to the cpu and s/w. Long pings, say 2 kbytes, have
round trip times which are even closer to the maximum possible.

Multiple hop connections work just as well or even a little better.
We see 5-6 kbytes/sec FTP transfers over 3 hops. This all works because
the system design and path/site selection was such to allow low bit
error rates. Note that this is over a dedicated backbone and not an
ALOHA situation. I believe that the answer to (1) is yes. However, it
is a qualified yes since it requires different hardware and a degree of
attention to system design not presently common within amateur radio.
From what I know of the wa4dsy/GRAPES h/w, I believe that it *can* also
operate with throughput which is a significant portion of 56kbps. It
seems I remember some of the Ottawa guys mentioning getting 5-6
kbytes/sec throughput over a single hop when everything is working.
Please see Barry McLarnon's, VE3JF, paper in the ARRL CNC proceedings for
more details of their experiences with 56 kbps. I also have a paper in
the 10th CNC as well as on the WWW page listed below with some more
experiencial details from this area.

The system here has been connected to the Internet, though at the moment the gateway is being moved and it is not yet back in full service. Even with a 19.2 kbps wireline connection to the internet, which was the dominant bottleneck, Mosaic ran pretty decently and file transfers across the globe were acceptable. I was able to send multi-100Kbyte files from my host in the hamshack(garage) to RA3APW's gateway machine in downtown Moscow at throughput of around 50kbytes/minute.

What is or is not permissable WRT to question (2) is probably not nearly so clear as the answer to (1). I suspect there may be discussions, arguments and opinions presented by any number of armchair lawyers over it. However, there's no question that, for me, the technical question and challenge is a lot more interesting.

So that I don't generate more requests for support due to the above h/w description than I'm prepared to service, I now redirect them to:

```
|--------------- N6GN's Higher Speed Packet WWW Page -------------------|
| |
| ftp://col.hp.com/hamradio/packet/n6gn/index.html |
| |
|-----------------------------------------------------------------------|
```

There are no kits, parts list or construction articles there but there *is* further information on what we've been up to.

>
>Can you explain the impact of "training sequences" on allowing better
>utilization of the transmitted bandwidth? Or point to a good reference
>that might explain it?

Ok. The bandwidth of the signal is a function of the modulation method and the baud you are sending. Now you can get more bits for a given baud if you pack the symbol in a more complex way, IE baud is symbols per second, but you can make one symbol stand for more than one bit with the proper encoding. Now symbols per second and modulation method give bandwidth, but by packing more than one bit per baud, you can get high data rates. QPSK is an example of a higher bit per baud encoding.

Now Shannon says we can trade bandwidth for SNR, so these packed symbols require a higher SNR than would simple one bit per baud encodings to fit in the same bandwidth. In the context of data radios, we have to worry about channel noise, multipath, and distortions in transmission and reception amplitude and phase responses. All will degrade the SNR.

We can't do much about channel noise except crank up the power of our radios, but we can do something about phase and amplitude distortions in the path by using training sequences to predistort or postdistort the modulating waveforms so that they will arrive in the proper form for decoding.

To do this, the modems must exchange test sequences with each other and adjust their predistorting characteristics to get a clean signal. This works fine on a phone line because the connection setup is done out of band, the line is guaranteed to have only the two modems using it for the duration of the connection, and the system is duplex, which allows the modems to efficiently train.

This won't work on a contending multiple access packet radio channel. Connection setup signalling is done in band, so the modems must be able to a priori demodulate each other's signals correctly. Since that's what training allows them to do, and they can't train until they set up the connection, we have a chicken and egg problem. Since the channel is contending, one predistortion won't work for all the different radios on the channel. So this means that we have to use a modulation that is easily decodable without training sequences, and that's going to limit the bits per baud we can use, and the number of baud for a given bandwidth.

>Also, when you say the bandwidth is limited (be regulation) to 20 kHz,
>what portion of the signal must fall within the 20 kHz? All emissions?
>Or emissions greater than -40 dB from carrier level?

For transmissions of less than 25 watts, emissions outside the 20 kHz bandwidth must be down -40 db. For more powerful signals, the emissions outside the authorized bandwidth must be -60 db down. 97.307(c).

There are a number of license-free 900 MHz spread spectrum
modems out there, giving bit rates from 9600 baud to T-1 speeds,
although the faster that you go, the range does tend to suffer.

While the purchase and installation of such a system will be more
than getting a 56Kb line, the costs after that are free, other
than maintanence... though 25 miles is pushing it as far as SS
technology and <1 watt power are concerned (including interference
from other users in that band). In other words, you need a literal
line of sight path, and some very good antennas to make this
work at all.

This is done as a "Part 15" device, and you do not need any sort
of license for this at all.. in fact, the way that the amateur
rules about SS are currently written, it's not legal to use any
of the presently-available commercially made equipment under
a ham license. Go figure.

It's do-able, just not in everyone's case.

2400 baud uses overloaded symbols, not a higher symbol rate. It should
work through most ordinary radios, though the SNR requirement is higher.
2400 baud appears to be an orphan standard, however. Only Kantronics
ever supported it, and the newer 9600 baud modems pass it by. Due to
the Tx delays and turnaround times associated with packet, 2400 baud
does not offer a 2x throughput advantage over 1200 baud as it might
naively appear. Real world throughput increase is only about 1.2x that
of 1200 baud. It's probably not worthwhile to change over to 2400
from 1200. It certainly is worthwhile to jump to 9600 and faster.
9600 can offer a real world throughput improvement on the order of
4x 1200 baud.

Ron, jnos is not "just for unattended node" operation. I have it running
in my personal mailbox and also in the clubs bbs computer. Not only does
it make an excellent personal mailbox when compiled properly it also
gives you all of the tcp/ip features that you want. (if you have other
tcp users around you) I am in the process of switching the club station
over to tnos/linux because of its' added features and stability for a
multi-users platform. It seems that you must have gotten a compile of
jnos that was intended to be used as a remote packet switch or node. We
run one of those in the club system too that is multiplexed to a 440

digital repeater running 19k2 baud. Makes for a pretty neat and fast system. The switch links the vhf and uhf ports quite effectively from the users point of view. It also makes a good local tcp/ip router for your smtp mail and telneting cross band from 1200 baud vhf to 19k2 baud uhf. So don't give up yet, there is a bit of work involved in setting up the supporting files, but once done you will be glad that you did.

I have an Icom 22U (not the A or S, but the U model) that works
great at 1200 baud packet. Anyone know if this radio will work
at 9600 with or without mods?

+-------------------------------------------------------------------------------+
HOW TO ACCESS THE WB3FFV AMATEUR RADIO INTERNET BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the
Amateur Community (but there are plenty of other wares on-line). Through
user support I hope to keep the latest and greatest ham software on-line.
The BBS also offers access to nearly all of the Internet (USENET) NetNews
groups, plus access to most Internet services such as Email, FTP, TELNET,
Gopher, WWW, Callsign Lookup, Etc... Below is the information that is
needed in order to access the BBS via Telephone, Telnet, or FTP. Please
pass it around to as many ham's as possible.

System Name: WB3FFV
User Login: bbs

410-661-2475 - 12/24/48/96/14.4/16.8/19.2/21.6/28.8
(V.32bis,V.32terbo,V.34,V.FC,HST,V.42bis)

410-661-2648 - 1200/2400/4800/9600/14400/23000
(MNP2-5, V.32bis, V.42bis, Turbo-PEP)

TELNET/FTP - wb3ffv1.sed.csc.com (20.2.1.80)

WWW - http://wb3ffv1.sed.csc.com/

Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: UniBoard UNIX BBS Software (Version 2.00b)
Misc. Info: Machine is an Pentium-90/MP running UNIX System V Release 4.2
and features more than 4 Gigabytes of on-line file storage.
Most transfer protocols are available!! (5 phone lines)

I attempt to keep the latest and greatest HAM software on-line, and encourage
all to upload anything new that they come up with, as it is of benefit to all.
Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
KA9Q TCP/IP (The NOS release) [UNIX, MS/DOS, Amiga]
KA9Q TCP/IP (Version by G1EMM, PE1CHL, PA0GRI, Etc.)
N2GTE Packet Message Switch [GTEPMS]
WA7MBL BBS for the PC
W0RLI BBS for the PC
MSYS BBS for the PC running KISS TNC's
AA4RE BBS for the PC (plus BETA versions)
```

F6FBB BBS for the PC
G8BPQ PC-Node (Version 4.08)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK
Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs

If you are interested in using UUCP to connect to the BBS, this can also be done as I support Anon-uucp. The login to the system is 'uucpanon', and there is NO password. The listing of avalible archives are stored in a file called 'FILES', and it is located in the /var/spool/uucppublic. To retrieve the files listing just use the following command:

uucp wb3ffv!~/FILES /usr/spool/uucppublic (ASCII Text)
-or-
uucp wb3ffv!~/FILES.Z /usr/spool/uucppublic (16-Bit Compressed)
-or-
uucp wb3ffv!~/FILES.gz /usr/spool/uucppublic (GNU Gzipped)

This will move a copy of my files listing into your uucppublic directory.

If you want to access the BBS via Telnet all you have to do is TELNET to wb3ffv1.sed.csc.com, and login is 'bbs' with no password required. To use anonymous FTP just ftp to wb3ffv1.sed.csc.com and login as 'anonymous'. This system is currently attached to the Internet via a dialup SLIP link, and should generally be available 24hrs, but at times the modem will drop the line. Also since this isn't the fastest link, I will be limiting the maximum number of anonymous sessions for the moment.

If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck...

>to set one. The result is the same as if I mispelled

You might check the INtface command. Seems that the default value is
NEWUSER, and you only have a limited command set available with this
setting. Try typing INTFACE TERMINAL and then issuing a RESET command
(required for the INTFACE setting to take effect.) Then you'll have full
access to the entire command set.

If that isn't the problem then I'd say your KPC3 is busted.

I'm running, of all things, OPUS 1.73 as a full BBS on the land line. All I had to do to give the BBS users access to packet was to purchase a copy of DOORWAY written by Marshall Netherlin. I run the AEA Hostmode program into a PCB88 AEA buss TNC card in an Integrand rack mounted 486DX66/2 system. It really ran quite well under DESQVIEW with QEMM, using COMM 1 for my own full station control package I wrote that drives an MFJ-1278B, the OPUS BBS system using a Zyxel internal 19.2+ modem on COM2, a mouse on COM3 and the PCB88 AEA card on COM4. The BBS uses the ZFAX voice/fax/data program as a front end; it will handle voice/fax/data all on that one land line. If no voice or fax arrives, the ZFAX system can be made to toggle into the BBS, whereupon the user has the full BBS on the land line. OPUS permits, as do other BBS packages, external calls to things like the DOORWAY package which is used widely to offer on-line games to users. In my case I simply hosted the VHF circuit on it!

Ran fine, then came disaster. I had to add the IBM voice I/O direct plans for the system as well. Voice dictation direct to disk and voice in for other developmental work I was doing. That meant OS/2, no other choice. The VHF TNC programs all blew up in this mess. All of the packages for TNC's

are polling type programs that hammer the CPU demanding attention for a port that may or may not have anything at it. I've gone through every program now available to me for the AEA PCB88, PK400, PK96, DRSI card, MFJ-1278B and even the BAYCOM units, looking for a way to stop the CPU thrashing in OS/2.

The first thing I did was junk IBM's COM.SYS and VCOM.SYS in favor of paying for Ray Gwinn's SIO drivers. Together with a paid for version of TAME320, I managed to stabilize the whole mess again until I was forced to change to WARP 3.0, which blew up all the tuning with the new session setting parameter it added.

Two programs by HB9CVV, Peter, PHS250 and THS450, written specifically for OS/2 on the AEA-232 controller and the DRSI card, respectively, quit working on the switch to OS/2 2.1. I cannot find him to see if these programs would solve the problem, if he has updated them. If they were available in a version that would work, your problem would be solved. Two other programs seem to be available for OS/2 and TNC's, written in Europe for use with only TAPR-2 clones, which I don't have. Ye god's ANOTHER tnc? They are also written and documented in German and do NOT work with any of my TNC's at all, even if the AEA's are not left in host mode.

If you have access to FidoNet, you may freq the files OS2COMX1.ZIP and also ZFAX2OP1.ZIP from Dave Tilley, Fidonet 1:117/130 that I have out there that will give you lots of help. I've gone through (*&(*&(* getting it all up with the VESA LB systems and the Adaptec 2842 SCSI controllers. The first file, about 750K needs to be revised to cover the VESA LB pitfalls and WARP OS/2 settings, plus more modem programs over the 25 or so I have tried. The second file will tell you how to get the ZFAX voice front end working in harmony with this whole mess under OS/2 as a DOS VDM. Zyxel says you cannot do this, but it can be done with a P/D TSR killer I document and the use of a state machine concept to toggle between voice mode for the BBS system and the true data mode on exit to data from ZFAX.

I run W5WQN, my BBS full time, and the VHF circuit all at the same time all the time at my fixed site. All low band CW out there, you can hear it alive each Sunday night, Monday morning really. For years, I've relayed the NCDX weekly DX list on 3516Khz at 25WPM for those who miss it on 7mhz and 14mhz. The bulletin from W6TI is at 0200 GMT on 7016Khz and 14002Khz simulcast followed by my repeat at 0245 GMT on 3516Khz. I'll gladly share any info you want, bu if you want to netmail me at Fido, you'll have to route it to the host 1:117/0 directly. 117/3000 is a private -unlisted- node and us at 117 are fighting over it's forced removal from Fido because it was thought by the previous R19C to be of no value to FidoNet.

Anyway.

I'm a guest at leviathan.tamu.edu for development purposes for a brief time.

Mike

>> amateurs for that band (ie. packet)
>
>Who's sending signals back to you when you're using a repeater's autopatch
>to call a non-ham? Hmmmm. Packet/internet autopatches????

The repeater. It is an amateur radio station handling third party traffic under the authority of the control operator. When handling third party traffic, a repeater may not be operated under automatic control.

>>- Only conducting 5% business is like being a 'little bit pregnant'
>

Ditto.

>>- The UHF link is being used to evade ISDN phone line charges.
>
>I don't understand this illegality of not being able to use a radio
>service to avoid paying for phone service.
>
>All autopatches can be construed to be 'evading' cellular service in
>areas where cellular service exists.

Yes. In fact 97.113, Prohibited transmissions says "No station shall transmit communications as an alternative to other authorized radio services". The rules no longer maintain a prohibition against competing with *wireline* services, but there is a prohibition against competing with other *radio* services. [Third party contacts are allowed under limited conditions when the content is "remarks of a technical nature relating to tests and remarks of a personal character for which, by reasons of their unimportance, recourse to public telecommunications

service is not justified."]

>Heck, you might as well kill off all land mobile radio as well on
>the basis of it's evading phone line charges (cellular or otherwise).

No, you can't, because land mobile is not a Part 97 service, and
Part 97 rules do not apply to it.

>What if you connected a computer (non-TNC) type modem to your radio
>and log into your internet account through the autopatch? How is
>this construed to be different from the UHF internet link mentioned
>by the original poster?

It's not different, both would be illegal if there is business
content. Both are third party transactions and must obey third
party rules.

From: Doug Freeman <dougfree@onramp.net>
Message-ID: <3jc6sm$dui@news.onramp.net>
Source record: 44591

I am new to packet radio and for what ever reason my ability to figure out the manual for the MFJ-1278B controller is getting me nowhere. So far I have been doing ok on normal packet connections but I have some questions about the Shuttle. I am using 145.55UP and 144.49dn frequences.

My questions are

How do I setup for automatic operation?
Do I use beacon mode and what text?
Should I turn Digipeat Off?

In general besides the controller set up what are the proper procedures? I did receive their packet dn information last night so I would really like to see if my new antenna and only 50w can make it up.

Thanks for you help,
Doug Freeman

>heard of 56k modems, and I know the bandwidth requirements would be
>different, but I just can't find any info on these. If someone could
>send me at least an address or phone number, I'd appreciate it a lot!

I assume you meant over, not about... Try sending mail to
"ve3jf@hydra.carleton.ca" (I hope that is the right address). That should
put you in touch with Barry, VE3JF (I also hope that is his call), and he
should be able to direct you better. The Ottawa group in Canada does have a
56k backbone running.

I realize there are a lot of I hopes here... Maybe someone else can clarify
the address better...

At one time you could not use land Mobile radio to evade Long Distance
charges. I once knew of one business where the owner had setup two Land Mobile Bases,
they were some 80 miles apart. Yes he was running 100 watts on 150 foot
towers. Also the stations were legally licensed. Where he got into trouble
was when he was observed using these stations for base to base operations.
Not base to mobile. Not sure just what rule got him these days, but he had to
dismantle one of the bases. His business was a small family grocery store.
They were chatting about the daily business receipts and ordering goods. The telephone
Long distance carriers had this type of communication tied up. I would guess it was
like going thru a gas station to avoid the traffic signal.

Hello !!

I have 4 high-speed (16c550) ports at my FBB BBS, and currently I use
BPQ, which work very well.

Unfortunately BPQ did not support DAMA mode, and therefore I have tryed
to install ESS and TheFirm 2.7

I run ESS with:

COM 1, INT 4
COM 2, INT 3
COM 3, INT 5
COM 4, INT 7

After a while my ESS lose communication with COM 3 and COM 4.

Is that a known problem, or is it someting specialy for my PC ??

Best regards

Michael / OZ1ENR sysop OZ3BUL * Copenhagen Denmark.

Welcome!

: comm people limit themselves this way ? Typically voice requires very little
: bandwidth but for longer periods than data, which requires wide bandwidths for
: very short periods.
: Is it a governmental/beurocratic regulation ?
Not as such, though the amateur bands aren't THAT widee□ except very far up.
: Is it because typically people use the same transmitters they use to transmit
: voice ?
I think that is the overwhelming reason - plus, also, wideband ones aren't that
widely available (and yes, many of us are NOT truly cabable of this sort of
homebrew, especially @ VHF and above, though quite a few are).
: Is it because it would be unfair to gobble up a larger portion of the spectrum
: (even though its for a shorter period of time) ?
Ho ho ... as has been found with packet, datacomms grows to fill the space
allocated, far more so than voice does! (Give people a megabit capacity, and
they'll start passing things they don't now. There was a spate of passing
pictures a year or two ago, but the senders got a lot of flame as they were
saturating the network.)
: Then again, am I totally lost and it IS possible to do what I'm looking for ?

Please tell us if you find out how ...
: Perhaps spread spectrum allows you to attempt this, albeit not as successfully
: and with greater difficulty ?
I don't think so - spread spectrum uses a wide spectrum, but only a little bit
at a time - the actual throughput is nothing like the bandwidth `occupied'.

Hello,

where could I find information about 56Kbps modems ? How do they exactly work, and what do I need to use them ? I beleive an ordinary TNC won't work :-))

I'm also interested in finding info about Manchester-like modems.

Thanks in advance,

Eric BERTREM / f5pje@stdin.gatelink.fr.net / Fido : 2:323/9.2

BARTG * GB2ATG * NEWS * BARTG * NEWS * GB2ATG * BARTG
This is the - British Amateur Radio Teledata Group - News Broadcast Service
for all Amateurs and Short Wave Listeners interested in RTTY Amtor, Pactor
and Packet Radio.

This news is broadcast during the first full week commencing Monday each
month, to the following schedule..

Evening transmissions at 20:00 U.K. local time on 3.584 MHz. Mark.
RTTY on Monday-AFSK, Wednesday-AFSK and Friday-FSK.
Pactor-FEC on Tuesday.
Amtor-FEC on Thursday and Saturday.

Morning transmission at 10:00 U.K. local time on 7.041 MHz. Mark.
RTTY on Sunday-FSK.

Both frequencies could be +/- for QRM.

An edited version of this bulletin is available on the Packet network as a
BARTG at GBR. file thanks to: Andy (G3ZYP) BARTG Chairman and Publicity
Officer at GB7MXM.#36.GBR.EU.

It is also posted on the "INTERNET" system via the INFO-HAMS list on UCSD.EDU.
thanks to Iain (G6ARO) who is available on the "JANET" network as
Iain@HUMBER.AC.UK

News for March 1995. Bulletin No. 027.

BARTG Information.
BARTG are proud to announce that their "New Improved Multyterm" Terminal
Unit for Pactor, Amtor, RTTY, SSTV, CW and FAX has just passed the
rigorous EMC testing in compliance with the EEC Standard EN 50082-1:1993.
BARTG is an Amateur Radio Club and is believed to be the first to have
obtained compliance to the EEC EMC standard which applies to Residential
Environment. Further details can be obtained by contacting BARTG Components
Manager: Ken Godwin (G0PCA). 11 St. Lukes Way, Allhallows, Kent. ME3 9PR.
Telephone 01634 271548.

RTTY DX Activity. (all times are GMT.)

3.5 MHz.
T94DD 1830, RA2FB 1900, EI3GZ 2000, IS0QDV 2100, LY1BZB 2130,
9A1BST and S57DX 2200.

14 MHz.
KL7XD and PY7AJI 0930, HI8BG and YL1ZE 1130, WP4Q 1200, DU1SAN 1230,
UA2AO and J20UFT 1400, 9K2KF and VK6GOM 1430,

4S7/JA4FM and EW8AU 1530, JW0I 1600, XX9AS, VE6JO and WL7EF 1630, CU2GE 1700.

21 MHz.
VP8CKN, C91A, TY1PS, HK1LAQ and ZS6YA 1500.

QSL Information.
4S7/JA4FM via JA1FHK. XX9AS via KU9C. T94DD via K2PF.
J20UFT via F5LBM, Patrick LaBeaume, 38 Chemin du Plateau,
F-67500 Hagueneau, France.
EW8AU to Vladimir N. Prihodko. Box 68, Gomel 246027, Belarus.
YL1ZE to Box 171, Bauska, LV-3900, Latvia.
JW0I (Henry SP3ASN) to Box 280115, Berlin 13441.

Contests.
The Spanish EA-RTTY Contest starts 1600 April 1 until 1600 April 2 on all 5 HF bands 80 through 10 meters according to IARU band plans. (Please note revised date for this contest.)

Classification:
A) Single Operator All Band.
B) Single Operator Single Band.
C) Multi-Operator All Band only.
D) Short Wave Listener.

Exchange Message:
RST plus CQ zone number.
EA stations send RST plus *Prefijo Provincial* and CQ zone number.
There are 52 Spanish *Prefijos Provinciales*

QSO Points:
On 10, 15 and 20 meter bands, score one point for QSO within own continent.
Score two points for QSO outside own continent.
On 40 and 80 meter bands, score three points for QSO within own continent.
Score six points for QSO outside own continent.
Contacts between stations in the same DXCC country are valid for Multiplier credit, but have Zero QSO points value.

Multipliers:
On each band, count one multiplier point for each CQ zone and each Spanish Province (*Prefijo Provincial*).

Final Score:
Total QSO points from all bands times total Multipliers from all bands.

Trophies:
Award and plate to winner in Class A).
Award to winners in Class B), C) and D).

Logs:
Use separate log sheet for each band. Include Summary Sheet showing, Scoring and other essential information. Official Log forms are recommended. Mailing deadline for all entries is May 5th 1995. Send completed logs to:

EA RTTY Contest Manager, Antonio Alcolado (EA1MV). P.O. Box 240,
-9400 Aranda de Duero (Burgos), Spain.

Notes of Interest:
J20UFT was operating from Maskali Island in the Gulf of Aden. IOTA AF-053

South Shetland Isl. (DP1). RTTY activity is now reported from
February 6 at 0030z on 14 MHz. QSL via DD6UAB.

Conway Reef (3D2). Plans to activate this one from March 24 until
April 3 using all bands and modes. QSL RTTY contacts to SM7PKK.

Spratly Isl. (DU0). A team from the Philippines A.R.A. plan to run
all bands and modes from April 10 to 16. QSL via DU9RG.

Thanks this month to..
G3ZYP, GU0SUP, DXNS, VK2SG/RTDX.

BARTG caters for all DATA interests with information-components- kits-ready
built units and professional software for the P.C. and other computers
covering all common data modes.
Members receive a quarterly journal devoted to data modes.
Beginners guides for most data modes are available which are currently being
updated.
The group sponsors HF RTTY - Amtor - Pactor contests, administers its own DX
and members award schemes and holds an annual rally.

933. ETHRAX25 Packet Driver

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-06 14:22:36 UTC
From: adsb@bnr.co.uk
Message-ID: <3jf5rdINN13s@bhars12c.bnr.co.uk>
Source record: 44625

Is there any special gotcha with this packet driver? Although I can see RS232 activity on the RD line (at the same time as the TNC LEDs tell me it's sending me data), PKTWATCH, PKTALL, and NOS all refuse to see any received packets. PKTSTAT (and pkstat in NOS) tells me that there have been a few errors.

I've set the speed to the right speed, set the driver to mode 6, the break-out box LEDs match the states of those when running other programs which can see the raw RS232 data, but still no packets....

Todd Owen towen@freenet.vcu.edu wrote:
: I'm new when it comes to microwave communications, although I
: have read many of the ARRL books on the topic. I live in
: Richmond, Virginia far from any mountaintopping. I am
: interested in what I can do with microwaves.

: Without a line-of-sight line, how far can I transmit? (I know

This is covered in Chapter 3 of the Microwave Experimenter's
Manual. Volume 1 of the RSBG Microwave Handbook also covers
this topic.

: there is no one answer to this question.) I am interested in
: 3.4, 5.7 and 10GHz on SSB and FM (ATV in the future). What
: would it take for me to reliably make EME contacts? dish size,

20 watts and a 10 ft dish seems to work on 10 GHz with CW. You
probably need another 10 dB for SSB--30 ft dish would let you
hear your own SSB echoes.

: transmitter power, etc.? Could I reliably use troposcopic
: scatter on these frequencies to contact Washington, D.C. (70
: miles) or Baltimore (130 miles)? Is one band better/worse than
: another?

As you move up the bands, attenuation due to trees becomes
more severe. However, for a fixed antenna aperture (2 ft dish,
for example) the path loss *decreases,* till you get past 20
GHz, where atmospheric absorption becomes a problem.

: I know that most 10GHz work is with Gunnplexers, around 100 to
: 250mW, can I amplfy this power? The 3.4 and 5.7GHz bands seem

Yes, if you can find a suitable amplifier. 10 GHz amplifiers
don't last long on the surplus market (in demand by amateurs).
New ones are in the same price range as low cost new cars.

: to use transverters to 1.3GHz and then to 144MHz for SSB, any
: suggestions? What kind of performance/distance can I expect from
: non-mountaintop microwave communications, before I invest a few
: thousand dollars?

Message-ID: <3jg09u$l74@ns.oar.net>
Source record: 44612

Hello,
I am looking for comments on Timewaves DSP-59+ DSP filter.
I especially am wondering how it does for AM shortwave listening
as far as knocking out noise. Also, does it produce any spurs or
garbage of it's own?

-Pete - KW9E

In <3j91ql$o1u@news.tamu.edu>, mluther@tamu.edu writes:
>There were two OS/2 TNC control programs written by HB9CVV that I tried,
>one called PHS250 for the AEA232 and one called THS250 for the DRSI TNC
>

Mike, HB9CVV put out THS/PHS 6.11 for OS/2. It works on everything
from 2.0 up thru the WARP Fullpack. It with the 232 and PK-900
and I'm not sure what else. I think THS works with all the TNC-2
clones. HB9CVV was on CompuServe, but haven't seen or heard from
him in 94/95. I have seen XHS (think that is PHS and THS together),
on some Ham BBS's. Its probably FTPable also.

Source record: 44615

Thank you, KE4ZV, for the excellent discussion earlier of baud vs. bps. It us an area of frequent confusion in the computer business, which is fairly harmless, but here in the RF world, it makes LOTS of difference.

This won't work on a contending multiple access packet radio channel...

Suppose we're talking about a backbone link?

... Connection setup signalling is done in band, so the modems must be able to a priori demodulate each other's signals correctly. Since that's what training allows them to do, and they can't train until they set up the connection, we have a chicken and egg problem...

Not necessarily. In the computer world, we tend to start with the highest rate we can support and back off when the channel won't handle that rate. In the RF world, in theory (e.g. presuming a suitable band plan), we could set up the channel at a data rate we know will work we know our signal is least, say S5, and then attempt to train for higher speeds.

... Since the channel
is contending, one predistortion won't work for all the different radios on the channel. So this means that we have to use a modulation that is easily decodable without training sequences, and that's going to limit the bits per baud we can use, and the number of baud for a given bandwidth.

But if we're only talking to one station, especially over a highly directional antenna, then do training sequences start to make sense (even if we have to retrain due to changing tropo conditions)?

Suppose equalization can be done entirely on the transmitting end (given suitable hardware), could one also then support a reasonably small number of other stations?

Myself, i think i would be inclined to explore different approaches to going fast (such as operating in a band where 100 KHz channels are already part of the local band plan), but that is beyond the scope of this discussion. Nonetheless, i would like to better understand the theory.

>Sure, in the 900 Mhz band. Only don't do it under Part 97,
>use Part 15 instead (non-Ham, unlicensed).

>No content restrictions (but there are other restrictions).

Trouble is you need to get the equipment type accepted.

Assuming you're not wanting to make a product out of it (e.g. you're
building to learn, have fun, or advance the state of the art; even if
that fun eventually might not fall under Part 97), then presumably you
could debug the concepts [and share it with the rest of us]. Then
go out and get type-acceptance for use under Part 15. Just don't do
your business here (e.g. the ham bands), or let someone else do that.
(Of course, there are many other folks here who understand the nuances
of Part 97 better than i do!)

Hi gang,
I have been looking around for PK-900 uses and they seem to be few and far between. If you are out there, how about dropping a note once in awhile if you have found any software other than PC-Pakratt that fully supports the PK-900. It would be interesting to try some new software once in awhile. Also, if you have any tips for new PK-900 users, include them in your comments. Thanks.

948. Alinco DJ580T <=> HK21 cable?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-07 04:04:07 UTC
From: swood@vela.acs.oakland.edu
Message-ID: <swood.794549047@vela.acs.oakland.edu>
Source record: 44639
Cross-posted to: rec.radio.amateur.digital.misc,alt.radio.digital

I am looking for some more information in regards to building a cable
to use my new (used) DJ580T handheld on packet with my Heathkit HK-21
pocket packet. I did a quick test, and the existing connector that
I built originally for my Heath and later used with my Yaesu.

However, I did notice in the DJ580T manual that there are collars on
both of the plugs (one for a remote and another to power the vox in
the optional headset)

If someone has any input that they could pass my way in regards to how
to go about building a cable for this connection, it would really be
appreciated. Thanks

In article <3j8gns$40t@yrkpa.kias.com>, jlamar@yrkpa.kias.com (John LaMartina) writes:
|>You may be walking a fine line on Part 97.
|>- One way transmissions I don't beleive are allowed per Part 97.

This has been discuss at length in r.r.a.p. There is no one way communication taking place here over an amateur frequency. Each end has a WA4DSY modem and would be transmitting.

|>- If you are receiving signals in return, they must be from licenced
|> amateurs for that band (ie. packet)

Again, the message content is third party traffic. The two ends of the link can both be controlled by a single operator. If he reads e-mail message sent from someone on a system somewhere on the Internet, the e-mail is third party traffic and the communication is still amateur station to amateur station. This is how NTS traffic is handled on the packet networks today. In his proposed system, he would be the first and second parties, and the originator of the e-mail would be the third party.

|>- Only conducting 5% business is like being a 'little bit pregnant'

This is the only problem with his proposed link.

|>- The UHF link is being used to evade ISDN phone line charges.

So what? That stipulation was removed from Part 97 some time ago.

Please state the Part 97 paragraphs that points 1,2, and 4 violate?

I have never used mine for this exact purpose, but it does an outstanding
job of reducing hetrodynes. It also does quite well in reducing white noise
on the bands. Mine does not generate spurs that I've been able to detect.

No such animal. The multi-tasking in JNOS is too complex for a easy
WINDOWS conversion. Johan (wg7j) mentioned that he was going to try
and tackle the problem about a year ago, but he hasn't been heard much
since then. He got married and moved to Japan. Put a crimp in his coding
time. :)

: > or phone number, I'd appreciate it a lot!
: > Matt - WL7SQ

: Hi Matt,

: There is definitly 9600 baud packet capability. You basicly have two
: ways to go.

: 1) Add a 9600 modem to an existing TNC.
: 2) Buy a TNC with 9600 modem built in.

: In catagory 1, at least Paccom, MFJ, and TAPR offer modems or kits that
: can be added into many TNCs.

: In catagory 2, Paccom, MFJ, Kantronics, and AEA all have TNCs that have
: 9600 built in. Some are 'high speed only', i.e. no 1200 baud, some have
: both, and some, like Kantronics KPC-9612 and AEA's PK-900 (with the 9600
: baud modem option) are able to do both at the same time on two radios.

: Give me a bit more info, like what TNC you are using now, if any, and I
: can give you what wisdom I have.

Ole,I have been using the PK-900 for over a year and find it
to be the best. As far as software is concerned there is only
one program worth using and that is XPDUAL by KF7XP Gary Johnson.
There are features in this program that will make you a believer.
Gary hangs out here when he isn't upgrading his XP line of
software.Demo versions of the software ar avabile at indirect.com
and his internet address is gjohnson@indirect.com and his
bulliten board phone is (602)898-1058.Gary is a very helpful guy
and will help you out any way he can.
Also the pk900 does a real nice job on SSTV using a program
called JVFAX version 7.0, All that is required to recieve SSTV is
to start your terminal program and set your hf modem side to
analog iI think its 8. shut off the tnc then exit your terminal
program and run JVFAX,thats it. To transmitt the program lists
the pk-900 as an output but someone will have to explain it to me
because the only way I was able to use it was to start the pix
download and key the mike in front of the pc speaker.
Good Luck and if you get the sstv to go through the 900
let me know. N3JPR Walt

>kc0rl@rmii.com
>"Ole"

Ole;
I really am a new PK-900 user myself. After trying Pakratt for windows
I wasn't really completely impressed (Ver. 1.0) so I went looking for alt-
ernatives and have found a couple here and there;
Lan-Link Shareware Current: ll232.exe
XPDUAL Shareware " xpdual155.exe
I hear there is a pkgold ?? that will work with the PK-900 as well.
Also for SSTV and/or Fax JVFAX70.exe.

Lan-link and jvfax70 can be found on the ARRL BBS. If you're interested I
can dig out the FTP adr. for XPDUAL.

re you using Pakratt for windows or DOS ??

Hi Jon,

When I was at AEA I looked at one of these radios with regard to 9600 baud operation. As I recall, the TX signal looked OK, and the RX signal seemed OK, but was not of a high enough level to drive the modem properly.

If your FT-5100 was manufactured after run 12 or so, the only mod you might potentially need for 9600 is to increase the output level from the radio's data jack, or to build an external op-amp amplifier for the RX signal.

I tried to convince Yaesu that 'us guys' (the modem manufacturers) needed more signal to work with, but as far as I can tell, Yaesu was more concerned about protecting the data output from incorrect connection and possible injury to the radio than with delivering more output. From what I remember each receive discriminator has its own buffer, and each buffer has a feedback resistor that it appears if was changed, would caus the radio to put out a higher level on the data jack.

Hope that helps!

73, Bob

> garbage of it's own?

The DSP-59+ is a terrific accessory. There is a new set of firmware which will be available soon in production units that is purported to reduce significantly the spectral distortion produced by the common noise reduction algorithms.

It works well on AM, with the caveat that the frequency response is limited to 200Hz to 3.8Khz (or maybe 3.2Khz - without the box here in front of me I don't remember). So you'll lose some fidelity if you are used to listening to AM shortwave through a fairly wide IF filter.

The noise reduction algorithm eliminates random noise well (hiss, static crashes, etc) and works reasonably well on line noise types. Don't expect perfection - and remember that some things you classify as "noise", may not look like noise to the filter -- and some things that are not noise to your ears WILL look like "noise" to the filter..

Life is a tradeoff .. :-)

In the UK, bands that don't require individual licences (such as cellphones)
and bands that don't require licenses at all (such as model control) still
have to have type-approval on the equipment. In most cases, this requires
an explicit test by an approved laboratory. It's possible that
self-certification is now used in some instances - I'm not sure.

Is type-approval required for equipment under the Part 15 regulations,
or is it a complete free-for-all ? I'd have thought that type-approval
costs would make homebuilt equipment uneconomic.

I was wondering if anyone in this group had experience using the mfj 1278b tnc for sstv. I would be interested in the software you are/were using. I have several friends using the mfj multicom software and they don't particularly like the package especially in regards to sstv operation. I've tried two shareware packages which were dedicated solely to sstv, but neither supported this tnc and I had no luck making them work. Thanks for any help coming my way.

Also, since this is my first post to this group, hello.
Jim

*** Please note, effective 11/1/94 the address of the internet side of
the gateway has changed from gate@wb7tpy.ampr.org to gate@stat.com
Please notify your contacts immediately of this change ***

How to Use the WB7TPY
Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has
a third-party agreement. All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.
No files should be sent.
(4) If you have questions, please do not hesitate to contact me either on
packet radio: WB7TPY@WB7TPY.AZ.USA.NA -or-
Internet : david@stat.com

(5) Have fun. Use the gateway as much as you like. That is what it is
there for.

From Internet to Packet

Send mail to the internet address of:

gate@stat.com

The first line of text must contain a full packet address, preceded with the
word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

** NOTE: this line MUST be left justified.

From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address,
proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

Internet: david@primenet.com

*** Remember, this has to be left justified

F.A.R.E.

ARCA PRESENTS ARRL

THE AMATEUR RADIO COUNCIL OF ARIZONA

SpringFest '95
ARCA ARRL
At Scottsdale Community College
Located East Of Pima Road On Chaparell

TALK-IN: 146.76-

SCOTTSDALE, ARIZONA

MARCH 11, 1995

MAIN PRIZES FREE ADMISION
---------- TAILGATING $5.00
PARKING $2.00
Grand Prize > $500.00 Gift Certificate
Second Prize > $300.00 Gift Certificate CAMPING:
Third Prize > $200.00 Gift Certificate After 3:00 P.M. Friday
Early Bird > $50.00 Gift Certificate NO Hookups
Self Contained ONLY
HOURLY DOOR PRIZES
MUST BE PRESENT TO WIN.

TICKETS: $1.00 EACH OR 6 FOR $5.00

T-HUNT SEMINARS YOUTH PROGRAMS LECTURES MEETINGS

VE EXAMS:
REGISTRATION: 8:00-10:30 A.M.
You MUST have original and one copy of your license and/or any applicable
C.S.C.E. Photo I.D. Required. WALK-INS ONLY. For Exam Information Call:
Dave Kelley, AA7TQ at 602-963-3527

NO-CODE TECHNICIAN CLASS

For Information and registration contact:
Morgan Riley, N7DLW at 602-938-4356

NO FIREARMS, BOOZE, DRUGS ALLOWED ON CAMPUS.
ALL PETS MUST BE ON A LEASH.

ARIZONA TAX REGULATIONS WILL BE IN EFFECT.

This is an ARRL Sanctioned EVENT.

For More Information Call F.A.R.E. - Len Winkler, KB7LPW at 602-861-0303
Or ARCA - Mark Kesauer, N7KKQ at 602-843-0960

From: conrad_sandiego@sahara.com
Message-ID: <292.1534.27.0N35D830@sahara.com>
Source record: 44587

-> Also, is there a seperate news group for SSTV ? I haven't seen much
-> on the subject here, and a news group title search I did found
-> nothing with SSTV in it.

Hello George .. I am into SSTV also, although hav been only "listening"
mode. I use the JVFAX program and a simple interface on my computer's
serial port. gives satisfactory picturesfrom stations having strong
signals. I heard Viewport is good sstv interface. what freq,and
SSTV mode are you using ?? SSTV activity in Saudi Arabia is NIL. I hear
mostly Europeans.

best 73 , de Conrad AB6ST/DU1CSU/HZ1AB op.

995. MFJ 1276 and Kenwood TS130S on Pactor.

X-Sun-Data-Description: text
X-Sun-Data-Name: text
X-Sun-Content-Lines: 8
X-Sun-Content-Length: 354

Could anyone recommend a good NOS package for TCP/IP Packet and the Amiga?
I'm looking for a package that would include good docs. (Help is limited in
this area with tcpip packet!). If you know of an FTP sight that would have
this software, please include this also. E-mail responses to:
zytec!owl!johnk@uunet.UU.NET

Thanks
John Krohn - KB0CGJ

997. Re: ACARS on 131.725Mhz

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-09 14:33:09 UTC
From: bmm1@freenet3.scri.fsu.edu
Message-ID: <3jn3j5$4ba@freenet3.scri.fsu.edu>
Source record: 44581

I have a multimode data controller called the DSP-12 that decodes
ACARS. The frequency to monitor here is 131.55 AM. There are all
different kinds of messages and message formats that come through on acars.
Ie. "need translator , pilot speeks only Czech" and lots of telemetry
with engine statuses etc.

>
>Suppose we're talking about a backbone link?

Many of today's backbone links are simplex, and contending. Several
relay sites may be in range of the same host. *Usually*, hidden terminal
problems are engineered out, unlike on the user side, but there is still
contention to deal with.

>
> ... Connection setup signalling is done in band, so the modems must be

>In the RF world, in theory (e.g. presuming a suitable band plan), we could
>set up the channel at a data rate we know will work we know our signal is
>least, say S5, and then attempt to train for higher speeds.

The problem with that is we'd have to do negotiation and training on a
packet by packet basis, and that's not feasible on a shared channel.
You have to identify the intended destination address embedded in each
packet to determine if it is for your station. Unless you've trained
with the particular sending station, you won't be able to do that.
You can't switch training in mid-stream unless you know the origin
of the packet, and you can't know that either until you decode that
particular packet's header. The call setup is *in-band*. That's totally
different from telco practice.

> ... Since the channel
> is contending, one predistortion won't work for all the different radios
> on the channel. So this means that we have to use a modulation that is
> easily decodable without training sequences, and that's going to limit
> the bits per baud we can use, and the number of baud for a given bandwidth.
>
>But if we're only talking to one station, especially over a highly
>directional antenna, then do training sequences start to make sense

>(even if we have to retrain due to changing tropo conditions)?

I assume you mean one *pair* of stations. Sure, if you've got the channel to yourselves, you can just use telco modems on a nailed up duplex pair. It'll be no different than the telco case. You don't even need the AX25 protocol. You could just run PPP or slip just like you would on a regular phone line. That type of operation is not what we usually mean when we refer to packet radio, but it's certainly feasible if you've got the free channel pairs available.

>Suppose equalization can be done entirely on the transmitting end (given >suitable hardware), could one also then support a reasonably small number >of other stations?

In practice, even two radios of the same make and model will be sufficiently different in response that individual training is still often required at the higher symbol overloadings we are discussing. With a given pair you might luck out, but it's not likely a general solution once you start adding other stations. Not only do the individual radio responses have to be considered, but also the particular radio path over which the signals travel. It's uncommon to have pure line-of-sight paths with no multipath between several stations. Multipath distortions have to be trained out, and since every station you'll hear will have a different multipath, you've got to train individually with each of them.

>Myself, i think i would be inclined to explore different approaches to >going fast (such as operating in a band where 100 KHz channels are >already part of the local band plan), but that is beyond the scope of >this discussion. Nonetheless, i would like to better understand the >theory.

Fortunately, SERA recognized that need in our area, and we have 100 kHz pairs set aside for duplex 56 kb operation, or for use as individual simplex channels as our local needs require, in the 70 cm bandplan. The ARRL bandplans too, make some allowance for 100 kHz channels at 222 MHz and 70cm. If we get the spectrum at 219 MHz, it's already recomended to be used for high speed fixed packet links on 100 kHz channel centers. The spectrum is available, the RF modems are available, the high speed digital pumps to feed them are available, all that is missing is the committed groups to build networks with them.

>Hello,
>
>where could I find information about 56Kbps modems ? How do they exactly
>work, and what do I need to use them ? I beleive an ordinary TNC won't
>work :-))

The Proceedings of the 6th Computer Networking Conference has a paper
by WA4DSY explaining the theory and practice of the 56 kb RF modem.
(I think it's the 6th, I don't have my copy handy.)

GRAPES furnishes instructions for modifying a TNC2 to drive the modem,
but there are better solutions. The Ottawa PI card and the Gracillis
PacketTwin card are two good solutions. Of course they are PC bus cards.
If you need standalone capability, the Kantronics Data Engine can handle
it, as can the incredible Gracilis PacketTen.

If you want information on the RF modem, full document sets are $20,
creditable towards a later order, write to GRAPES at

GRAPES, Inc
PO Box 636
Griffin, GA 30224-0636

GRAPES is the Georgia networking organization, IE a volunteer
club. There's no phone number, and turnaround on info requests
may be slower than when dealing with commercial outfits. Please
cut the volunteers a little slack.

>
>Issues are the ability to connect through (IP in and AX out) and
>monitor both sides from the terminal.

You don't need special hardware to do this. Any version of NOS
will give you this capability automatically. You can have multiple
connections of varying kinds going through the same KISS TNC and
radio at the same time. You can also have ethernet and telco
connections going at the same time too, and NOS will route correctly
between all of them. You can trace selected connections to watch
all the activity on the screen if you like, though at high speeds
this can exact a performance penalty because the screen can't be
updated fast enough. It's somewhat uncanny to see the screen scrolling
for several seconds after a 56 kb modem burst, trying to catch up.

You are allowed to build your own Part 15 devices, quantity one, without
need to go through the Type Acceptance process. You can't start manufacturing
them or offering them for sale without Type Acceptance. So you can experiment,
though you are still responsible for staying within the Part 15 rules. You
just can't go into business with Part 15 devices unless they are certified.

1009. NET_Mac2.3.48.sea.hqx.text

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-10 08:16:19 UTC
From: adam@iag.TNO.NL
Message-ID: <9503100816.AA00770@iag.tno.nl>
Source record: 44491

```
The Netherlands, March 10, 1995.
Hello dear reader,

Today I distributed NET_Mac2.3.48.sea.hqx...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac I implemented the following:

- Tailor ARP console-output
- Replaced 'Text Capture FKEY v2.1' by version 2.3
- Fixes for AddResMenu() bug in System 7.5.1
- Fix a bug that causes a bomb when a user selected 'sesscreen 0 0'
- Implemented new command 'axtext [<message>]'
- Implemented new command 'nrtext [<message>]'
- 'tcp mss' is now 216 by default
- 'tcp window' is now 432 by default

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim archives.

The new NET/Mac has (hopefully) been uploaded to:
ftp.ucsd.edu, to the directory hamradio/packet/tcpip/incoming.
If it's not there then look at hamradio/packet/tcpip/mac.

Scott WY1Z may have also uploaded the new version to:
oak.oakland.edu, to the directory pub/hamradio/mac/digital

Kind regards and (maybe a little early...) Merry Xmas and a prosperous 1995,

Adam PA2AGA (e-mail: adam@iag.tno.nl )
( or: pa2aga@iag.tno.nl for letters only, NO BIG files here)

P.S. If you send me mail one of these days, then don't expect a reply within
2 weeks, because I will be skiing in Austria until March 25.
```

>: I know that most 10GHz work is with Gunnplexers, around 100 to
>: 250mW, can I amplfy this power? The 3.4 and 5.7GHz bands seem

If you read books on microwaves, forget all that is older
than a few years. Your statement is about as correct as
"For the hf bands spark gap transmitters are used"

Now days on *all* microwave bands transverters are used,
with the exception of some high speed data links using
gunplexers.

As to 10 GHz the standart setup is a transverter for 144MHz,
using a 1 - 2 ft dish. Power is 100mW to 1W, from a transistor
amplifier. Receiver nf is 2-3 or roundabout dB.

EME stations use travelling wave amplifiers, and 30 ft dishes.
Steering of the dish becomes a bit of a challenge then...

A 10 GHz transverter kit costs over here about 500 US$.

Gidday,

I have seen recently that Paccom are offering a TNC like device that is attached to the computer parallel port.

We are looking at a cheaper way to attach a HAPN 4800 modem to our NOS gateway and would like to know how complex the circuit is and whether it is easy to build up. Judging by the price in Australia it is unlikely we would buy the commercial item.

Also need to know if there is a NOS FTP software driver available for it. (I know of the PLIP one for joining two machines via a "Lanlink" cable)

Thanks;

The SMC_WD.COM driver from the V11 =update= file, rather than the original
V11 files.

If you have a clone, you may find the WD8003E.COM driver from the V10 set
works better.

: let me know what CLOVER is. Ken--73's

CLOVER is another digital mode like (and not like) rtty, amtor, pactor, gtor and packet. It is unique in this group because it uses 4 different tones (I think) instead of the 2 tones the rest of the modes use. I'm not sure if it also uses amplitude modulation or not. It is currently available from HAL only as far as I know. Things may have changed by now, but when it first came out, I think it was only available as a plug in board to a PC (IBM or clone) and costs in the $900-$1000 range. I think I've seen price reductions recently down in the $600-$700 range.

This is all from memory, so if I've got anything wrong, please correct me.

73,
Jim.

Source record: 44502

I've been trying to contact the Russian space station MIR on my
2m HTX-202 on 145.550 via packet, so far no luck.

I have heard it twice. On 9-9 it was R0MIR was calling CQ at 11:00am.
On 9-10 is was acknowledging KC5BIL at 10:00am.

I assume it has 11.5 hour orbits, but know little. I also assume the
overhead pass was not near to my local (Dallas,TX) since it can't hear
me.

Does anyone know when a good pass of MIR will occur over Dallas,TX ???

I believe I heard the USA space shuttle on 145.550 on 9-9 at
about 9pm, but not sure, barely caught some of the audio.

Does anyone know when a good packet pass will occur for the
space shuttle over Dallas,TX ???

1017. Digichannel COM/Xi by DigiBoard

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-10 19:14:23 UTC
From: ROBCARTIER@aol.COM
Message-ID: <950310134004_45409337@aol.com>
Source record: 44505

I am looking for any assistance on the following topic. I have an 8-channel intelligent
serial async card . It is porduced by Digiboard and the model # is a DIgichannel COM/Xi.
It has on-board an 80188 and says it will handle 8 ports running at 56 kbps. Well that
is all fine but it doesn't appear to use anything I am familiar with when it comes to
com1 - com10 and address 3f8,2f8,3e8,2e8 irq 3,4,5,7 . It apears to use INT 14 under bios
and addresses starting at 0x100, 0x110, 0x120, ox200 ox220 ox300 0x320. It also allows the
following irq for the board itself which can be 3,4,5,7,10,11,12 and 15. Well all this is
very nice and all but I was thinking of using it for either MSYS or JNOS and these programs
want absolute values for their async ports (ie. 3f8,irq 4..etc). If anybody has had
experience or some idea how to use it for the above requirement please send them along.

Hi there. This is Arata KK5IP.

I'm postiog this for my friend senor Toyoda JA1HTR.

He is a good Dxer and fluent Spanish speaker.
He usually works CW and SSB on HF bands. And he also
works on VHF & UHF packet.

He wants to know BBS stations on some major cities
in South America. Because he wants to exchange
packet massages in Spanish.

If you know some BBS stations in South America,
please send him a packet message or e-mail me.

Thank you.

Gidday!

I'll be the first to admit that I don't understand what the trace screen nmemonics mean when it comes to solving problems but I believe I have a problem with my gateway.

What happens is that it starts sending a file, forwarding or something large and continuous in connected mode it suddenly starts getting rejects and retries after 32 packets or so. I get the impression that the gateway is sending one frame out of sync with what my system wants.

Below is the trace screen I got when I downloaded a 11K odd file. I have removed all the unneccesary bits.

File moving from B to A

```
A->B I NR=1 NS=0 pid=Text
B->A I NR=1 NS=1 pid=Text
A->B RR NR=2
B->A I NR=1 NS=2 pid=Text
A->B RR NR=3
B->A I NR=1 NS=3 pid=Text
A->B RR NR=4
B->A I NR=1 NS=4 pid=Text
A->B RR NR=5
B->A I NR=1 NS=5 pid=Text
A->B RR NR=6
B->A I NR=1 NS=6 pid=Text
A->B RR NR=7
B->A I NR=1 NS=7 pid=Text
A->B RR NR=0
B->A I NR=1 NS=0 pid=Text
A->B RR NR=1

B->A I NR=1 NS=3 pid=Text
A->B RR NR=4
B->A I NR=1 NS=3 pid=Text
A->B REJ NR=4
```

Both machines are NOS running JN108DFF. The A system uses a TNC220 in KISS mode @ 9600 carrier DCD and the B system runs a Paccom device also in KISS @ 9600 but with software DCD (open squelch). The radio data rate is 1200BPS HDX.

There is nothing especially remarkable in the ax setups. The parameters are as follows.

```
A&B machines
ax25 version 2
ax25 maxframe 1 B A
ax25 paclen 256 persist 64 64
ax25 pthresh 128 slottime 10 (100ms) 10
```

```
ax25 timertype linear TXDelay 25 (250ms) 20
ax25 retry 16 TXtail 5 5
ax25 window 1024
ax25 irtt 4500
ax25 blimit 30
ax25 t4 900
ax25 t3 0
```

I have had a very unscientific fiddle with txtail irtt and blimit but nothing noticable changed.

Listening to the audio I get the impression that the gateway (B) is actually sending 2 packets per burst when it gets to the erronous area. Maybe it isn't waiting long enough for the response from the A machine?

Watching other users on the gateway I see similar problems, so I believe the problem is there. I don't have any kind of retries in UI modes like Telnet & FTP.

I'm sure I must be doing something silly here but I'd still like some assistance in finding the cure! I'm trying my hardest not to bog down the already overloaded system!

73's from Bob in Armidale NSW Australia.

>don lloyd- thanks

Don,

I do not have the address at hand but MFJ is on Compuserve in Hamnet section 12.
I am not sure if they monitor Compuserves E-Mail system, which is the way to get them via internet.
Maybe some one will jump in here and have the proper address for them on compuserve.

>: tnx &73 ... Rob

the callbook server is at electra.cs.buffalo.edu
the database can be used in various ways, you can look up a name,
part of a name, a call, a city, so on, use the protocol (for example
if you are looking up a call)
>call (the call)
it will then return with the name and address
if you only have a name
>name <name>
You get the picture, I hope, 73, Frank KM1Z

> Jim
>
>

Hello Jim, this response is my first post to Internet much less this group
:-)
Anyway, I use my 1278B with the multicom software and the MAJOR problem is
with the PCX graphic to MFJ SSTV conversion software routine. It sucks big
time. The quality of the converted graphic is so distorted it's
embarrassing. The receive quality is poor as well when compared to what's
available vie such simple things as JVFax or the Vestor program.
The problem is solely in the software. The hardware is fully capable of
4096 colors but the software just blotches the whole thing up.
I am an experienced but non-professional programmer (I do it for my own
entertainment), but if I could find a pro programmer who wanted to work on
a windows software package to drive the MFJ to its full capability, I would
REALLY like to get in touch with them. It could turn into a small
commercial venture as well.

Anyway, after all that rambling, the MFJ has lots and lots of potential but
MFJ didn't pursue the software aggressively enough to make it a competitive
product at least in the SSTV arena. Use the multicom software. You'll
receive and re-transmit adequately, but don't expect any decent results
from your own graphics -- at least until we get better software developed.

I'd love to swap pics on air with you or just chat. Let me know if you'd
like a sked.

Can someone help me with information regarding the digital control codes for
the BOSCH mobile phone type FSO 457.
These are very modern (4 years old) 430MHz mobile phones and currently sold
here in Holland. The only problem is the mike/control unit is not included!
So i have to make my own one and therefore need some info about the
communication between mike unit and mobile phone.
I already made an simple PC interface and found out that the bitrate is 4800bps
with 7 databits and even parity, all on 1 bidirectional wire (bussi).
It is possible to set TX and RX frequentie, squelch level, audio level etc
with this interface, and stored in a serial EEPROM inside the unit.

Some details :
BOSCH FSO 457
F-2-25-00

produced by :
Robert Bosch GmbH
Mobile Kommunikation, Berlin
Germany

Source record: 44523

Your baud rate between the computer is and TNC are wrong!
When that is right, you will get the CMD prompt, whether a radio is connected or not.
This is assuming you have selected the proper port and IRQ settings.

After making the INTFACE change to KISS, you must also perform a
soft reset for the new mode to take effect (see RESET in your
manual).

KaGOLD from Interflex Systems is a very popular terminal program for the KAM+.
It runs in host mode making it very easy to operate with multiple connections and/or multiple modes.
It also has a monitor window so you can see what other signals are on the air besides your current connection.
Its an MS-DOS program but runs fine under windows.

I'm not affiliated in any way with Interflex Systems, but I use and like KaGOLD a lot so I don't hesitate to recommend it.

You can contact Interflex at 714-496-6639 by voice or on their BBS at 714-497-5860.
Or on the Internet contact gold@interflex.com.

...
```

B is broken. When B receives an R frame with NR=x, its next frame should be transmitted with NS >= x. The lines I marked with !@# indicate B's messups. I didn't walk through the long trace looking for all of the problems. Above are at least two of em.

How would one wire the KPC-3 for the RS HTX-202? The wiring diagrams for cables, as illustraded in the reference manuals that came with the KPC-3, are for various transceivers, but not for the HTX-202. One person told me that the cable wiring diagram for the Yeasu hand-held radio is the same for the 202. Is he correct?

Source record: 44522

I want to build the HamComm3.0 interface, I am only interested in the receive circuit; but I am confused about something.

There is a difference between the schematics in the manual, and the schematics in the help menu. In the help the PTT circuit is conected to the receive circuit; in the manual the PTT circuit is supossed to be omited to receive only.

What is a PTT circuit? Which circuit should I build to receive only?

If it is possible send your answers to my email, I dont have direct USENET access.
Thanks for any help you can give me.

Gidday

Haven't looked at it closely but is it easy to wire link two X1J
equipped TNC's with a ROSE one?

I could probably get away with a third X1J on the ROSE backbone but it
would be nicer from the user standpoint to get it to work this way.

Thanks for any thoughts;

From: Jeff Wigal <jwigal@wsunix.wsu.edu>
Message-ID: <Pine.OSF.3.91.950312153711.9034E-100000@unicorn.it.wsu.edu>
Source record: 44530

I am having some problems with receiving packet on my BAYCOM modem. I have made a connection with it before, but this was with a packet station that was in the same room as my BAYCOM modem was. I can hear packet stations coming in at full quieting, but the modem will not decode them.

Also, are there any BAYCOM manuals that 'elaborate' or are in a better english translation? There are some places in the manual where it is unclear what the author is trying to say.

Thanks in advance,

1053. fbb and pk88/232 in host mod?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-13 07:19:41 UTC
From: wroth@netcom.com
Message-ID: <wrothD5DB0t.A4K@netcom.com>
Source record: 44535

I'm trying to get a pk-88 to work with the f6fbb software using the host mode capabilities of fbb 5.15b or c. I've been able to get the tnc to talk with fbb software such that monitoring with F5 shows incoming and outgoing packet frames when someone connects. The connectee just gets my ctext message, and that's it. No BBS comes up to the remote user. I can connect from the "console" to port 0 and log on the BBS.

In my ports.sys, I've tried
different "modes" to no avail. I had a sysop who was a beta tester look over my ports and init.srv files and he said they look ok. I am also able to communicate host 2 letter commands using the F7 command key. So the tnc and fbb are definately talking. Also, when the tnc is initialized during fbb startup, a screen comes up and several 2 letter host commands are shown being sent to the tnc.

I did try a pk232, but no more success than the pk88. What I need is someone familiar with the quirks of FBB and AEA host mode. Can it be done? If so, did you have to set up the tnc any special way? Could you send me your init.srv, port.sys and inittnc1 files?

Thanks in advance.

Javier, The PTT is a push-to-talk ckt that is uded to mute an external
receiver when you press the mike on the xmtr, this prevents the receiver
front end from being harmes by the rf pwr of the xmtr, since they are
probably on the same antenna.
I have the CompuServe WEFAQ.FAQ text file that gives a better schematic
of the comparator ckt. If you want i'll send it to you with a better
sketch. I use the comparator ckt with HC3 and JVFAV7 (fax & SSTV), and
am pleased with it, even though it's the "low end" of interfaces.

All,

I have read quite a few messages lately about serial cards. Here is the info you may need.

There are basically two types: an 4 port card and an 8 port card.

They either have on board micro (normally a 80188 - which is a 8088 core plus additional functions such serial interface, DMA controllers and the like) or just standard 8250 chips and derivatives.

The ones that DONT have a micro (compatible with AST Four port), either 4 port or eight port normally have switches to select either standard PC setup or special. Standard PC setup makes the first 2, COM1 (3F8/interrupt 4)and COM2 (2F8/3) andf the other two something else (normally 2A0 and 2A8). Interrupts are shared in this case (see below).

Special setup makes the card with special addresses and interrupt modes. Addresses are 2A0, 2A8, 2B0, 2B0 or 1A0, 1A8 etc. In this case, the interrupts are selectable from either IRQ 2, 3, 4, 5, 6 or 7. When the interrupts are used in this way, the micro must read a byte from an address, which denotes the serial port number by the bit that is turned on. In other word if the number read is 04(00000100), it is the third port that has caused the interrupt, and so on.

This is the case for cards with 8 ports as well.

If the card has a micro, whether 4 or 8 port, the micro performs all the serial data handling functions. The user software just reads and writes to a specific place (normally via the INT14 interface) and the card does the rest. In order to make it easier to use, a device driver is used. This is read during startup by entering its name in CONFIG.SYS. You should have the manual with the card as well as the software. Since these cards have onboard micros, speed is high and exceeds PC speed (56KB/sec against 19.2KB/sec for normal PCs - which at this rate would be mainly used up for serial data support).

IBM PS/2 systems using the MCA bus dont have this problem. In fact now with plenty of second hand PS/2 systems (such as the 60, 70 and 80) you can install a MCA 8 port serial card (costs about $50) and you dont have any switches to set. In this case Windows offers 8 ports.

Finally, Unix systems, such as SCO, Interactive/Sun and others handle such cards automatically upon startup and are able to recognize the settings automatically.

Best,

Peter, KC1QF

Merle Rutschke (at286@yfn.ysu.edu) wrote:

: How would one wire the KPC-3 for the RS HTX-202? The wiring
: diagrams for cables, as illustraded in the reference manuals that
: came with the KPC-3, are for various transceivers, but not for the
: HTX-202. One person told me that the cable wiring diagram for the
: Yeasu hand-held radio is the same for the 202. Is he correct?

Here is the way I wired my KPC-3 to work with the Radio Shack HTX-202:

D-9 PIN#

1 --> .1 uF cap to pin 7

3 --> 3300 ohm resistor to pin 7

7 to tip of small (3/32) plug.

5 to tip of larger (1/8) plug.

6 to sleeve of small plug.

9 to sleeve of larger plug.

as shown in the KPC-3 manual, the D-9 radio connector is wired like this:

Pin 1- AFSK out
Pin 2- XCD (squelch-not needed)
Pin 3- Push to Talk
Pin 4- Audio in (from radio)
Pin 5- Audio in (from radio)
Pin 6- Ground/shield
Pin 7- Default is open-can be configured with wire jumpers to do a 'hard
reset' by grounding pin 7.
Pin 8- Ground/shield, same as Pin 6
Pin 9- Ground/shield, same as Pin 6

Note: A jumper in the KPC-3 (J2) can be used if you're using only an
H.T. that requires the capacitor and resistor. The value of the
resistor in the KPC-3 is 4700 ohms, which did not work with my
HTX-202. It needed the 3300 ohm. I used pin 7 as a convienient
tie point to install the resistor/capacitor. I could have changed
the value of R4 in the KPC-3, but I set my stuff up to use
numerous different radios.

Has anyone managed to successfully decode ARQ3, picolo-RTTY or any of the other 'utility-band' modes using a PK900? I called around looking for software to do same for the PK232 and nothing commercial seems to exist. Everyone seemed to agree that it would be possible to decode these modes using a PK900.

The other option, for receive-only, seems to be the Universal Radio decoder M-7000 board for the IBM PC @ $400!

I agree. Play with the baud rate between the computer and the TNC (it's probably much faster than the 1,200 baud you use on the air). Reset it and test it by powering down the TNC and bringing it back up. If you get gibberish on the screen, try again until you see something that makes sense.

Also, the CQ video, "Getting Started in Packet Radio" will be helpful in the non-technical aspects of packet operating (such as how to make contact with someone or how to use a packet bulletin board). It's $19.95 + shipping from CQ Communications at 1-800-853-9797 (outside US: 516-681-9222 / Fax 516-681-2926).

> If you need standalone capability, the Kantronics Data Engine can handle
> it, as can the incredible Gracilis PacketTen.

Right, the PackeTen is pretty interesting. A group here in Utah has a couple, and might buy more pretty soon. In literature I got from Gracilis last year, a future PackeTen with ethernet product was mentioned.

But, I have not been able to establish contact with Gracilis over the last month or two. Their voice telephone answering machine at (708)801-8800 accepts messages, as does their fax machine at (708)844-0183 and their info@gracilis.com e-mail address, but I have received no replies.

If anyone knows what's going on at Gracilis, please do post info. So far I have heard a rumor but that's it. Maybe, if the same rumor comes from independent sources, it will end up being true.

Thanks for the followup, and in fact that turned out to be the problem.

As an aside, the minimum TXDELAY setting that works with the TM-733a is around 150ms. It does not work with the faster 70ms setting that the TEKK KS-960 handles. But, at least it is faster than my Standard C5718DA radio, which not only does not work with a TXDELAY below about 250ms, but also does not switch from transmit to receive fast enough to handle replies from other stations on the 431.75MHz 9600bps network here in Salt Lake. But, the radio is at the Standard service department now, so hopefully they can help.

Gary

The manufacturer is actually in Korea. The phone numbers above are for
their U.S. operation. The U.S. operation >may< be the only place to
purchase ham-band models of the radios. A number of folks locally have
purchased these and use them very effectively on 9600 baud packet.

This is not the same as the BPSK modem that kb4nj is using.
Unfortunatly for him, the company that manufactured the only remaining
modem chip ceased production of it about 2 years ago. It's my
understanding that Kantronics bought up all remaining stock.

> I've purhased few XTALs but done NIL yet.
>
> BTW, could you half all the timers (frack, dwait...) when 1200 -> 2400bps
> (exept TxDelay ofcourse)...just a taught...?

Not really.

On-air testing of 2400 baud usually only results in a 33% performance
improvement, because of TX Delay. To get a worthwhile improvement in
speed it's necessary to have radios that can use TX Delays that match
the baud rate improvement. Very very few radios designed for voice
operations are really good for packet at 1200, let alone 9600. As an
example, with a solid-state switched crystal controlled radio on 1200
baud it is possible to operate with TX Delays of 50 mS or less, yet most
radios require using a TX Delay of at least 5 times that value. It's
even worse using the same radios for 9600 baud - where a station with a
quick radio could actually sneak a whole packet in while the slow radio
is trying to get on frequency and transmitting.

When I was at AEA I tried either a FT-2400 or FT-7400 on 9600 without
modifications, at the request of Yaesu. It did not work. I was not
allowed to pursue it further, to see if the usual modifications would
work. Unless Yaesu has made some major changes in the radio in the last
year or so, it's not possible to use it out of the box at 9600.

[Article crossposted from uk.radio.amateur]
[Author was steve roberts]
[Posted on 13 Mar 1995 23:17:25 GMT]

Greetings,
I wish to set up a general decoding station i.e. weather satellite,
general fax/rtty etc using a 486 pc and Linux to control the various
receivers and perform the decoding. Does anyone have any unix progs
source code or ftp sites that may be useful??
I will probably have to hack the Linux kernel :-(, any suggestions?
Has anyone used the Maplin dsp weather satellite interface?
My basic setup would be an AR3030, FRG9600, dedicated weather sat
receiver and interfaces as required...including the Maplin interface.

Cheers Steve Roberts

>able to switch the TNC into KISS-mode.

2.1d? This is not standard TNC firmware (Is it TheFirmware?)

With a normal TNC firmware eprom, you can get KISS. I don't know if WNOS has the ability to change the TNC into KISS mode (JNOS does). From a terminal program at the cmd: prompt, send the commands

KISS ON
RESTART

The front panel lights should blink three times, indicating that the TNC is now in KISS mode. You can then start WNOS.

>So please, can someone give me a
pointer, if there is an EPROM/firmware>which has the KISS-mode in it and from which www-/ftp-site (or what ever)>is this EPROM-bin-file available???

KISS-only firmware is available from ftp.tapr.org in /tapr/software_lib/tnc/eproms.exe (along with 1.1.8a and the state machine)

Hi and tnx for reading my message. I'm relatively new to the mode of Pactor and have been able to make several contacts with other stations successfully. My question is about APLink stations and Mailboxes.

First, what are APLink stations, where can I find them and what can I use them for?

Second, I have seen what appears to be beacons for station's mailbox. If I connect to them can I only leave mail for that station?

Lastly, I was told that there are gateways from Pactor to the Packet AX.25 network. Where are these locationed?

Tnx and 73's,
Peter

Hi Sharon:
I also bought my latest upgrade of Baycom from Tigertronics. The
latest version that I know of is 1.5, and, it comes with a bound manual!
But don't let me mislead you, the manual leaves some things to be desired.
The Baycom group seems focused in on 9600 bps and faster stuff so I
really don't expect any more upgrade for the 1200 baud stuff.

: outside the authorized bandwidth must be -60 db down. 97.307(c).
[]
As is often the case, a slight assumption that this is a usa. newsgroup (do they actually have them? We have uk. ones!). On most amateur bands in the UK, my understanding - though it's a while since I looked carefully - is that the REGULATIONS only regulate what may be out of BAND (is a similar way to the above); within the bands, apart from one or two, it is legally a free-for-all, with what mode is used where done by general consent (which amazingly seems to work fairly well).

1081. Success! but endless questions ariseth...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-14 13:55:45 UTC
From: pruth@ocvaxa.cc.oberlin.edu
Message-ID: <3k4791$1j1@news.cc.oberlin.edu>
Source record: 44462

Thanks to all who helped me get started. It was indeed a
baud rate problem: using 2400 baud for the P and I setups
did the trick. I wanted to be able to decode the current
SAREX packet traffic while the mission was in full swing.
HOWEVER: Two local amateurs were using 145.55 for routine
ragchews and connects between themselves, even during those
precious few minutes of STS-67 rising above the horizon!
Is it possible there are hams out there (one was at least a
General and the other an Extra) who may not realize 155.55 is
the designated Mir/Shuttle downlink frequency for voice nad
packet? Or is 145.55 not as sacrosanct as I think? Is there
anything written saying specifically what 145.55 is to be
used for now? I tried to connect to the two parties on packet
but didn't want to add to the (?unauthorized?) clutter on
145.55 and opted to send them friendly postcards instead,
pointing out the intended use for 145.55, which they may not
have realized, but I find that hard to believe. I hate to think
they were just being lids. Anyone else have problems with
145.55 earthlings?
Another realization this newcomer to packet has is that packet
does not seem to be as "weak-signal" a mode as I had hoped.
Even with the volume of my Standard C528A cranked up all the
way, relatively loud bursts with relatively low signal strength
don't register. Not only have I not been able to capture Shuttle
packet yet, but terrestrial packet stations are not coming through
on the screen, even though the audio level seems to be very high
and clear. Is there a threshhold adjustment that might give me
"weak-signal" or "weaker-signal" packet capabilities?
Thanks for indulging in my bandwidth-hogging inquiry. Please
respond by mail if possible, as the newsreader here is not always
easy to access. 73 --Bill KB8USZ pruth@ocvaxa.cc.oberlin.edu

I believe 145.550 is a general simplex frequency. But its down right
rude for hams to being this for ground contacts in the middle of
a shuttle pass.

Hello!

I've got an Amiga with 'Amicom 2.1' and a TASCO TeleReader TNC-20,
now I'm searching for a driver, because my TNC supports neither
the host-mode nor the kiss-mode.
I've got firmware version 2.02, where can I get updates and what's
the address of TASCO, because the manual doesn't mention it :(

Thanks ;)

Byebye!

So what?? Isn't it time to put to rest once and for all this myth about nothing being allowed to compete with the phone company. Your 2 meter ht is being used to evade Cellular Phone charges. Your packet message from NY to Ca is being used to evade not only long distance phone charges, but also postage. Big deal.

>HTX-202. One person told me that the cable wiring diagram for the
>Yeasu hand-held radio is the same for the 202. Is he correct?

That's correct. The HTX-202 is compatable with Icom and Yaesu
speaker microphones, so the same wiring is used. The Icom wants
a 10k pulldown resistor while the Yaesu wants a 2.2k pulldown.
So, the Icom circuit often won't key the Yaesu, but the Yaesu
circuit will key the Icom with slightly reduced audio level.
So use the Yaesu circuit and you'll have a cable that will
work with all three radios, just make sure you set the audio
level out of the TNC correctly for 3 kHz deviation whichever
radio you use.

1086. Using TPK 1.83 with KPC3/COM3/IRQ9

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-14 15:44:46 UTC
From: mconner@rain.atms.purdue.edu
Message-ID: <3k4dle$59b@mozo.cc.purdue.edu>
Source record: 44465

I just purchased a Kantronics KPC3 and am trying to hook it up to my Gateway 2000 tower system. I have many of the lower-numbered IRQs taken up by other devices. I can configure COM3 to work with IRQ 9 and can talk to the TNC using the Windows Terminal program. However, when I run TPK in a DOS window, it gives me an error message at the beginning saying it cannot sense a DSR. Then it attempts to send the commands to the TNC anyway, but there's no response. Here's my list of ports/IRQs

IRQ Device

2 Sound card
3 Mouse
4 COM1
5 CD-ROM
6 ?
7 LPT1
8 ?
9 COM3

I can only set my COM3 port to IRQ 4,5, or 9, and my COM1 port to 2,3,4,5, or 7. Ideally I'd like to move one of the other devices to IRQ9, but I can't due to other hardware/software limitations. Also, I believe that TPK cannot work with IRQ 9 - can anybody confirm this for me?

If anyone has any hints on using TPK on a "loaded" system, please pass them along. E-mail greatly appreciated.

145.55 is reserved for space use by gentlemen's agreement,
but as you discovered, not all hams are gentlemen (or ladies).
This is indeed liddish behavior, but not illegal. It's possible,
of course, that these two fellows are ignorant of the gentlemen's
agreement, passing a high speed Morse test doesn't automatically
make you a better or more alert operator. A gentle word with
them may be sufficient.

>"weak-signal" or "weaker-signal" packet capabilities?

Cranking up the volume, the all knobs to the right syndrome,
may make things worse rather than better due to distortion,
and due to overloading of the TNC modem. Remember, you are
still using FM here, and it's the SNR of the basic FM signal
that's going to determine how pure the tones will be at the
TNC. Once corrupted by noise in the FM demod, very little
can be regained by processing at audio in the TNC. Expect
to need at least 12 db quieting in the FM receiver before
the BER of the modem is going to be reasonable.

When receiving FSK or PSK via a SSB receiver, much better
performance can be expected. Since the SSB demod is linear

right down to the noise floor, post-processing in the TNC
can yield a high return in improved BER. But AFSK on an FM
channel isn't going to be a weak signal mode.

That out of the way, however, you should still get good print
from signals that sound somewhat noisy to the ear. If you aren't,
then one or more things could be wrong. The most critical thing
is *tone twist*. That's when the AF levels of the high and low
tones are different at the TNC demod chip. Ideally, they should
be the same level, but I've seen cases of up to 9 db of tone
twist with some radios and TNCs.

Twist is caused by equalizing circuits in the radio or TNC that
are improper. Often, the pre-emphasis and de-emphasis circuits
in ham radios are not standard. And some TNCs had a design fault
in their pre-filter that compounded twist, the original MF-10
circuit in the TNC2 and it's clones is a case in point.

The solution is to bypass these circuits by connecting directly
to the demodulator of the radio, and altering or bypassing the
pre-filter in the TNC. It's also helpful to connect directly
to the modulator for transmission to prevent sending twist.
Most people recognize this as necessary at 9600 baud, but it
can matter at 1200 baud too.

The second problem that can cause poor print is running *too much*
audio to the TNC. You should never crank the volume to a point
past where the DCD just flickers with the squelch open and no
signal present. More audio just overdrives the TNC and causes
more errors. Loud does not equate to good.

I apologise for the vagueness of this note in advance!

My friend has a DOS JNOS version that has HTTP abilities built into it. The problem is, that you can't use the standard tnc connect procedures, and need to use some sort of kiss/tnc/packet driver.

Does anyone know what driver is required, and where I can get it?

I'm running LINUX. Is there a way to shoehorn a web browser into JNOS/Linux?

Question was asked about experience with Timewave DSP-59+. I have used one daily since August and it has far surpassed my expectations. I have a desk full of Datongs, Auteks, Heath, Kantronics, etc (collect audio filters among other things!) and the 59+ puts them all to shame.
..
Have used other DSP top of the line filters and none came close to the flexibility of the Timewave. With the new EPROM due out any day the future looks even better. Am well satisfied with it's ability to cope with line noise but the new chip is supposed to do even more. Also the performance on digital modes has been fine tuned. I use Pactor and Gtor in the highly congested 20 meter window. Even with the best of internal filters in my Kenwood transceivers they can't cope during peak hours. The DSP-59+ makes all the difference.

For shortwave listening the variable high and low cuts allow you to squeeze the selectivity width as much as you need to and still have higher frequency response than lesser fixed bandwidth filters.

If a person doesn't plan to use the digital mode features one of the cheaper models would probably make more sense.

With the multitude of variables to play with it does having a learning curve, time should be given to experimenting with what suits the user best. In other words it is a knob twister's delight...but you can get lost in the possibilities without learning all the functions!

You will need to run tcp/ip software as well. There are some folks working on
web support to NOS, but I don't think it is in any of the common releases
(yet).

1101. How to suppress computer interferences ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-15 12:55:23 UTC
From: leconte@irisa.fr
Message-ID: <3k6o3r$oj4@news.irisa.fr>

I have an old FRG-7 recever and I try to use it for rrty and fax
reception on my PC.
My problem is that when I switch on the computer I have so much noise
on the recever that it's quite impossible to listen to weak stations.
Is there a magic solution to this problem ? :-)

Thanks in advance

ARRl has a reasonably priced book on solving interference problems, about $15
or so at many (of the few) ham radio outlets. Dunno if you have much access
to this stuff in France, or where you are geographically without the work to
dig it up. To summarized, as best as possible, in short:

1.) Get the receiving antenna as far away from the varmint as possible. That
means feeding the antenna, which is as far away as possible, with coaxial
cable and matching the system so that the standing wave ratio on the feed
line is as low as possible. Keeps the computer noise as far away as possible.

2.) The idea for the above, really focuses on shielding the receiver input from
the noise. That is what the shield of the coaxial cable does, provided you do
not defeat its purpose by introducing more noise on it as well! We prevent
that, as much as possible, by grounding everything in the system to a common
flat copper strap that is a ground buss on the table or in the equipment rack.
This strap, in good installations, actually goes outside to a better than average
earth ground. The computer, if possible, and all the correct ground points for
it and the shields for the interconnecting cables, is grounded to this buss. It
will turn out to be difficult to do all cables and shields this way, but, in
principal, this is the idea.

3.) What ever improvement you can get from it and how you get it, the
computer itself has to be shielded, i.e. there must be a metal case around it
so that the computer can't leak out noise over the outside of the cable shields
for the cables that plug into it. That's tough to do, if the manufacturer was
not kind enough to do the job for you! The same goes for your CRT monitor.

Many such shields are actually sprayed on metalized coatings on the inside of the plastic cases that house these noise pests. You may often isolate a bad one by unplugging it from your computer to see if the noise gets better. CRT and other devices are often horrible sources. If you can turn off and/or pull out the CRT video cable and the noise goes away or decreases, you have found more of the problem!

4.) For this fix, whatever good you can do about it, you will need a double hand full of ferrite cores, ususally sold in a splitable box shaped piece. You wrap several turns of the target cable in coils over this core, then snap it shut. Goes as close to the connector end as possible. There are also those types of suppressors that snap around the cable. On many video monitors, you will see these round blocks already affixed.

5.) Another source of this noise is that carried along the power cables. The core bit can help here, but an effective suppressor may also be found in a good surge suppressor. For exanple the Tripp-Lite variety has a decent number of DB of noise suppression between each block of two outlet pairs down the line. As much as 80-120 DB of noise isolation between units plugged into the thing can be had from one end of the suppressor to the other. Plug your receiver into the most isolated place on the unit.

All of the above is useless against a really dirty computer system.

One of the things we learn to do is REALLY pay attention to how noisey a given piece of equipment may be. Sometimes we just cannot afford to use certain equipment in receiving sites simply because it is too noisey to even put into service. Life's tough.

The ARRL book on fixing interference is a super good text on the above.

Good luck from across the pond.

Yeah, for starters they're half-duplex. It's a full-duplex world everywhere
else, but every packet radio technology out there now (so far as I know) is
half-duplex. You get your hopes up and then they're dashed to itty little
bits when you realize that you've been spoofed by marketeers.

Also, you want a 25 mile long radio link? Goooooooooooood Luuuuuuuuck.

> Can anyone else comment on this? Is there a viable radio modem link that
> can be operated under the rules of the Amateur Radio Service that produces
> a truly high-speed link?

Not a ham. Just a spy. I'd be delighted to find that there were a hot-shit
high-speed digital ham packet solution, but I don't think there is. So far
as I can tell, it's all low-speed stuff...talking weird protocols that don't
stack up to tcp-ip. And you can't encrypt anything or you'll have tons of
people snitching to the FCC about how evil you are for violating "part X."

Yuck yuck yuck. For mobile remote connectivity, I prefer alligator clips
for a fraction of the price and a 100x performance improvement [*].

>
> Trouble is you need to get the equipment type accepted.

Just buy commercial equipment.

I have a pair of 900MHz spread spectrum modems from Metricom. Their data rate is 100 Kbps...half duplex, so you get about 35 Kbps. Cost is $600 each. I haven't tested them heavily, but I understand that they work at ranges of up to a mile or so apart w/o real antennas. I haven't hooked up better antennas yet. http://www.metricom.com

There's another company doing similar stuff with a more hardcore approach. Teatherless Access Limited has (almost) a product which is an enhancement of Cylink's AirLink product. They incorporate full TCP/IP routing capability and operate at longer ranges. I talked to TAL last week and I understand that they'll have product in a few months...$6k/each (a friend called them and thinks he was told $6k/pair, but I think he was confused). Their data rate is 160 Kbps...half duplex again, so that's more like 64 Kbps. TAL is targetting networking providers (like sprint and mci) in rural areas and in 3rd world countries and I suspect that they'll be going with exclusive marketing deals. http://www.metricom.com

There's also the AT&T WaveLan product (used to be NCR, but they were eaten). 2 Mbps, again half duplex... Relatively short range, but they also sell a yagi to go along with them...don't know what kind of range they get with yagis. $700 for a PC board (range ~ 1000 ft ??), $2k for an embedded PC with the wavelan board and an ethernet board, and about $300 for external antennas, I think. Anybody have a URL for these??

Again, you want a 25 mile long radio link? Goooooooooooood Luuuuuuuuck.

I was really irked when I found that my spiffy new Metricom units were half-duplex, but then I found out that everything out there is half-duplex and so now I only fault the product literature but not the product. The Metricom units are cool little gizmos. Once I have some free time, I want to see what kind of range they can get with good antennas and line-of-sight.

>Melbourne, FL duty now for the future of amateur radio
>

Thanks Bill. You can actually use any of the programs like PMCOMM or HYPERACCES as a simple solution to the problem. That does stop the CPU bashing that takes place as result of the polling type code used by nearly every DOS TNC programmer writer. It doesn't make a good TNC program as far as using the full features of the better TNC's.

I got XHS611 off one of the BBS'es that has a now functional set of HB9CVV's PHS for the AEA line and THS for TAPR-1/2 clones for OS/2. It won't easily handle the mailbox function of the AEA 232/96/900/88 series, but other than that it is a wonderful program that I found does work fine in OS/2 warp.

Thanks for your suggestion.

ADRS announces new WWW and FTP sites
-----------------------------------------

The American Digital Radio Society (ADRS), publisher of the Digital
Journal, is pleased to announce its new WWW and anonymous FTP site
addresses now available for use by its members and others in the
world wide ham radio community. THE ADRS WWW and FTP servers are
at a commercial site with very high capacity connections to the
Internet network so that you should encounter no difficulties or
delays in connecting!

The ADRS Web Pages describe and give information about the ADRS, its
publications and services, and contain what is now probably one of the
most complete set of hyperlinks connections to other amateur radio related
WWW sites and related Internet sites worldwide! You are invited to visit
the ADRS WWW Pages at: http://www.iea.com/~adrs to learn more about
ADRS and as the best starting point for exploring amateur radio on the
Internet! To use the ADRS WWW site, you need will need an access to the
Internet which permits you to use Mosaic, Netscape or a similar Web Browser
which provides HTTP (Hyper Text Transfer Protocol) capability. (The new
Prodigy Internet WWW Web Browser was tested and performs well.)

The ADRS Anonymous FTP server contains software libraries which
mirror much of the software which is available on ADRS' BBS, including
the latest versions of special software available only from ADRS.
Files on the FTP server are downloadable. You are also invited to
visit that site at: ftp.iea.com/public/adrs . An extensive listing of
other amateur radio Anonymous FTP sites with hyperlinks to those other
FTP sites worldwide is also included on the ADRS WWW Pages
at: http://www.iea.com/~adrs . To access the ADRS FTP site, you will need
an Internet access over which you can use an FTP client to transfer files
using FTP (File Transfer Protocol).

1111. OS/2 PI card driver for JNOS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-15 19:14:28 UTC
From: daheath@ibm.net
Message-ID: <3k7eak$29u1@news-s01.ny.us.ibm.net>
Source record: 44391

I've put a beta copy of my Ottawa PI card drivers for OS2
on hydra.carleton.ca /incoming . The file is JNOS4OS2.ZIP.
Included are both Physical and Virtual device drivers for
the PI card and JNOS110i with the replacement driver
built in. Remember it's a Beta and *may* still have a bug or two.

JNOS runs better under OS/2 than it does under DOS because
more memory is available - up to 730+ kb in fact. Also
your computer can continue to run other applications while
JNOS is running in the background.

Sounds like a serial port mismatch. In other words, your serial port and
TNC are operating at different baud rates. Within Paccomm, if you can
change the serial baud rate, do this until you find the one that works.
Otherwise you will have to take the cover off, relocate the reset jumper
(sorry but I'm at the office and unable to look up which one now but I
can get back to you) power up the TNC and reset it to default and let the
autobaud routine run until it corresponds to the serial port speed. You
can drop me a line if you need further info. 73.

There's a PI2 card device driver for Linux; maybe it can be hacked to
work with a PackeTwin.

The PI2 card device driver is coded much like any other Linux network
device driver; you don't use JNOS for Linux or anything like that to
access it. You ifconfig it just like any other ethernet card (except
for setting the callsign).

The driver comes with the AX.25 kernel patches for Linux; but the most
up to date copy of the pi2 should be FTPable hydra.carleton.ca.

arrrrggh! what a horrible thought!

Just fire up the Linux version of Netscape - surely the best
(graphical) Web browser available. If you need a text mode version try
Lynx. Linux has excellent networking built into it, might as well use it.
Have you considered punting JNOS as using the Linux AX.25 kernel patches?

> has lost track of the sliding window count.

Care to elaborate on that. You are talking to a dumbo.... Bear in mind
that the trace doesn't necessarily reflect reality as it is a HDX
circuit and a packet shown as sent may not leave until the TNC is clear.

> It might be because
> of the RR (poll) RR (final) sequence above. Note that the problems
> you're seeing could be because your RR packets are getting stepped
> on by some other station. You _are_ using an omni antenna, right?

Specifically I'm not using an omni but that isn't the reason. It happens
with other users direct and via a digi. Fortunately there are only 5-6
infrequent users on our gateway (say) every 24 hrs! We celebrate when
more than two people get on the channel at the same time!

I seriously believe there to be a problem here (at the risk of sticking
out neck!) as the tests were done under controlled circumstances.

Any further thoughts? I wonder if anyone is a similar situation would
like to give it a try with my params and software.

One might also assume that they were neither ignorant nor rude. There are all sort of folks in the hobby with all sorts of priorities. Unfortunately sometimes a particular group will decide to take a particular spot for themselves - and the other users, for whatever reason, don't feel obliged to just quietly go away. IMHO they are no more ignorant or rude than the folk who arrive and announce that they have formed a "gentlemen's agreement" with themselves to take over a particular slice of spectrum for their own preferred activities. It seems to me "equal access" and "first come, first served" are good models to follow and that we shouldn't deprecate fellow hams who choose to follow priorities or activities different from our own.

1118. tcpip: adding me to the gateway?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-16 13:40:04 UTC
From: pete@freenet.grfn.org
Message-ID: <3k9f3k$juq@locutus.Bethany.ORG>
Source record: 44421

Here is West Michigan we have a gateway setup to the internet. From
my 'regular' internet access (freenet) I am able to telnet to some
of the .ampr.org hosts that reside on the local tcpip network. When
I try to telnet to myself, no go! I think it has to do whith the
fact that my address is not part of the domain name server being used
on the 'internet' end.

How do I go about adding myself to the 'route' as some of the other
stations have done around me? I see that these guys have a domain
name server set up as ucsd.edu.... do I need to be there?

I suppose it involves having the gateway operator setting up the route
to me. no?

I'll get this tcpip stuff yet!

mconner@rain.atms.purdue.edu (Mark D. Conner) said:

MD>I just purchased a Kantronics KPC3 and am trying to hook it up to my
MD>Gateway 2000 tower system. I have many of the lower-numbered IRQs
MD>taken up by other devices. I can configure COM3 to work with IRQ 9
MD>and can talk to the TNC using the Windows Terminal program. However,
MD>when I run TPK in a DOS window, it gives me an error message at the
MD>beginning saying it cannot sense a DSR. Then it attempts to send the
MD>commands to the TNC anyway, but there's no response.

I'm using TPK 1.83 with my KPC-3, only I'm using COM2. Another fellow
in our club had this same DSR problem, and he solved it, but I never found
out what it was. I do know It had something to do with a setting in the
CONFIG.TPK file (he left a vague reference in my mailbox along with "I
FIXED IT!"). I wasn't aware that TPK supported COM3/4 with selectable IRQs.
Are you sure it does? Did you try using TPK on your COM1 with the standard
IRQ setting?

Also make sure you're using a standard modem cable that has all of the
control signals wired.

MD>I can only set my COM3 port to IRQ 4,5, or 9, and my COM1 port to
MD>2,3,4,5, or 7. Ideally I'd like to move one of the other devices to
MD>IRQ9, but I can't due to other hardware/software limitations.

Where is COM2? Is that your mouse? Given that your mouse uses IRQ3, I'd
assume so.

MD>Also, I believe that TPK cannot work with IRQ 9 - can anybody
MD>confirm this for me?

I'd have to check when I get home. I think it only works with COM 1/2 on
standard IRQ 4/3.

I'll try to remember to check...

: For transmissions of less than 25 watts, emissions outside the 20 kHz
: bandwidth must be down -40 db. For more powerful signals, the emissions
: outside the authorized bandwidth must be -60 db down. 97.307(c).

This is the WORST written part of part 97 there is. A big part of this is that the appropriate definitions are actully in Part 2 of the regulations. It usually takes most people at least 10 readings to really get it right. There are 2 different types of interference possible. The first is called spurious emmisions and the second is out of band emmisions.

The quote above does NOT reflect 97.307 accurately. The new section is 97.307(e), and it refers to SPURIOUS emissions not out-of-band emissions.

The amateur community has played fast and loose with these two items, frequently mixing and matching at will (including many "experts" at the ARRL).

SPURIOUS emmisions are anything that is NOT related to the modulation process. This is things like weird mixer products, harmonics of the carrier, etc.

OUT-OF-BAND emmisions refers to interference that is a by-product of modulation. These include key clicks, splatter, and over-deviation.

I STRONGLY URGE ALL AMATEURS to read both Part 2 and 97.307 several times to fully understand how the FCC defines these terms. We SHOULD NOT use them in any way other than that way to avoid confusion.

Hello All;

I am looking for information about getting replacement parts for the Radio Shack discone scanner / ham antenna. I really like the antenna's reception by my antenna has developed a problem.

The plastic center insulator and the plastic disk that separates the disk from the cone are both cracked and broken allowing water get into the coax. I asked at my local Radio Shack store for those parts, but when they called into their parts depot in Barrie, Ontario, they were told that cannot supply those parts.

I have heard that Radio Shack buys these antennas from another company. If this is true, who makes the antenna? I heard it was possibly Diamond. Can any one tell me? And supply me with a address, phone / fax number for that company (really only the name will do, I can find the rest.)

Also, if there is anyone out there who works for a Radio Shack in the United States, can they get the parts I need? If so I am willing to buy 2 or 3 of each part (so I will have spares).

Thank you for your time.

```

There is a simple and VERY CHEAP solution to this I discovered way back in 1979/1980 with a Sorcerer Computer (Gee where did they go?) and M80 rtty board. It generated S9+ noise across the HF band, but was OK on 2 metres and above.

Anyway, what you do is create a coil of about 6 loops (18" to 24" diameter) with the co-ax line coming into the radio and place it underneath the computer. This is a bit variable for different bands but I was mainly using it on 14 Megs. One of 2 things will happen. The noise will increase dramatically or goto about zero. If it increases then place the coil upside down (or reversed/out of phase). You may have to play with coil sizes etc., but it does werk extremely well.

As I mentioned it is cheap but more importantly, it werks! :-)

THS/PHS is in the packet library of the Hamnet forum on compuserve.
I uploaded it there, with HB9CVV's permission, of course, about 3
months ago. It is good solid software, and runs great in OS/2 2.11 or
Warp 3.0. (I've tested it on both.)

The version on Compuserve should be the latest and greatest. I've only
tested it with the PK-232, but I believe it also supports the CP1 and
I know it supports the PK-900.

: > : From where are those radios coming?
: > The radios are made in Japan.

: My KS-960 says "MADE IN KOREA" on its case.

I was in Germany for few months and saw there those. Always taught they are coming from Germany.

In my opinnion they were too expensive -> I need more than few QRGs to work (might need) as I don't attend to establish only a ponit-to-point STN.
What do you think?

Is there rapid PLLs? (I've heard it's difficult to make one -> TEKKs are XTAL-based).

I was wondering if anyone has been able to get jvfax to work with the
mfj-1278b. Has anyone been able to get any sstv software to work with this tnc,
other then the mfj multicom, which, when it comes to sstv, frankly sucks.
If so I would like to hear from you via e-mail.

Source record: 44423

Howdy:

There was somebody that was asking for packet clusters close
to the Dominican Republic. I got the ARRL repeater directory
in the mail. Although there are none listed in the DR. However
there are two in Puerto Rico at the western coast of the island
that you *might* hit them. I do not have the book here (douh!) but
I remember that one of them was in Maricao, PR which is located a couple
of feet over sea level (I've been there, one of the few places in PR
that you are going to find a fireplace.). I think that the other one is
in Aguadilla, close to the coast.

The only problem that you might have is the distance between wherever you
are and the clusters.

Hope this helps... I can get you the frequencies upon request.

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

1156. TAPR 9k6 modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-17 20:01:51 UTC
From: dme@ingersoll.COM
Message-ID: <9503172201.AA12128@ingersoll.com>
Source record: 44436

Hi all,

I have a link setup with a Motorola Maxar/MFJ1270B/TAPR Modem at one end, and a Kantronics D4-10/MFJ1270B/G3RUH Modem at the other end.

Everything is tweaked reasonably, and the received eye patterns look pretty good at both ends. The D4-10 end is receiving pretty much error free (best I can tell without a BER test point), however the Maxar end is not decoding as it should. The eye at the TAPR modem at TP1 does look good.

I did some poking around and determined that the 16x clock from the tnc looks pretty close to spec, but the RX clock at TP2 is not 9600hz like the manual states. I measured 10256.4 Hz instead. On calibrated lab equip. at work I also verified this.

Could this fast RX clock contribute to poor rxdata recovery?

The Maxar end is decoding many of the packets ok, but is sure not optimal. I am also seeing some data being received with characters garbled occasionally also.

I have not yet played with different TX waveform settings on the G3RUH yet.

Any suggestions from you 9k6 gurus out there?

Thanks,
Dave N9HKM

1157. More on digital bandwidths

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-17 20:05:04 UTC
From: mack@mails.imed.COM
Message-ID: <9502177954.AA795478305@mails.imed.com>
Source record: 44437

This is a follow up on my post from yesterday.

There is an additional piece of information necessary to understand how to measure the allowable bandwidth for theses emmissions. Part 97.307(f)(5) expressly limits us to 20 KHz bandwidth for data emmisions. (I almost made a really stupid flame on that one!) Part 2.202 is where you will find the definition of what that 20 KHz means:
(paraphrased)
Occupied Bandwidth: The frequency between the two 0.5 percent power points of the emmision.

This isn't exactly correct but it boils down to measuring the frequencies at which the output power is 23 db down (0.5%) from the carrier.

This means that if you have energy outside of the 20KHz bandwidth that is more than 0.5% of the carrier power, you have an "out-of-band emmision"!

This is Jim Thomas N9MOO. Since the n4pcr gateway has been down, we have not
had email access to the ke9yq gateway for mail in the Chicago area.
Because of other difficulties, it looks like we may also lose ke9yq so
we are looking at getting other gateways established.
At this time N3QEM has setup a Internet link for TCP Conferencing to the
Internet Ham conference. I expect that soon, we will be able to link to the
Internet thru his station. This will be discussed further at the next
CAPRA meeting on May 6th during the combined TCP Users Group and CAPRA meetings
in Geneva. The next TCP Users Group Meeting will be this saturday in Geneva.
I can be contacted at thomas_jim@macmail2.cig.mot.com or on packet at
n9moo@w9zmr.il, or n9moo.ampr.org. My node n9moo-1 is on 145.59MHz.

I have a kpc9612 I use for demos and testing. You must have the KISS driver attachment compiled into it. Then attach the first port for 1200 bps as usual. Then use attach KISS. The parameters needed will be 1 for the second port and the label of the first port and then the label of your second/9600 port.
If you type "attach KISS" it should return a example. Jim Thomas N9MOO

RR>Would someone please advise which packet driver to use with
RR>the WD8013 interface card?
RR>thanks
RR>bob

I've used the SMC Elite 16, which, I _believe_ is similar to that one
(maybe not that exact model, but it was a similar model to WD's).
Anyway, on the disk that came with it was a packet driver. It worked
just fine with JNOS.

You need to have the route set up by the gateway and any intermediate
stations. Have you tried telnetting to your ip address? That will bypass any
calls to a dns.

There is a robot for adding yourself to the ucsd list. You should probably
add mx records to point to the gateway or other suitable station. Look at
ftp.ucsd.edu under /hamradio for more information.

>

While this letter is getting old, the info should still be accurate (except
maybe for price.

((::extract follows::))
From: IN%"payne@crl.dec.COM" 2-MAY-1993 07:23:39.55
To: IN%"distribution:;@easynet.crl.dec.com@easynet.crl.dec.com@crl.dec.com
(see end of body)"
CC: IN%"payne@crl.dec.COM"
Subj: SUMMARY: TCM3105 information

Here's the summary of sources for the TCM3105 chip in the US and Canada:

Active $6.47/each, $25 mailorder minimum
(800) 677-8899

JDR Microdevies $9.95/each, no minimum order
(800) 538-5000

Arrow about $10.50/each, $25 minimum
(800) 932-7769

I've confirmed Active's and JDR's quote. Watch the part numbers when ordering,
especially from Active. The 'J' suffix means ceramic package, and the 'N'
suffix means plastic. Plastic is cheaper and just fine for this application.

Outside of the US and Canada, you might want to try (I've confirmed none of
these):

R.S. Components (UK) UKP (7.73), their part number is 638-380
+44 536 201234

Active (Canada) (same as Active above, but for international orders)
(514) 630-7410

For the 4.4336 MHz crystals, Active lists them in their catalog for $0.88.
They aren't that hard to find; they happen to be the PAL colorburst
frequency.
((::end extract::))

If for some reason Active or JDR don't have the crystals in stock (or in the
case of Active they are being nasty about our piddily $25 orders, which I guess

makes us 2nd class citizens)- call DigiKey in Minnesota (1-800-digi-key), they have them for $1.25 each, and are not difficult to deal with (or slow and sloppy for that matter).

Disclaimers: everything is IMHO, but isn't everything these days
I guarantee nothing about the prices, and if they have indeed jacked up as I suspect, would someone let me know.

73, happy hamming
_Chris

Hi Pete,

It's not clear from the above if you have an IP address in net 44.
Typically the only stuff that those gateways pass to the radio port are
net 44 addresses (44.x.x.x) which is assigned to the ampr.org domain. So
if you are trying to use a non-ampr.org host or non net 44 IP address,
you probably won't get any joy. You'll probably need to apply to your
local amateur IP address administrator for an ampr.org address in your
local subnet.

>
>How do I go about adding myself to the 'route' as some of the other
>stations have done around me? I see that these guys have a domain

Once you have an address in the subnet that the router sends to the air,
you'll probably be 'on the air'.

>I suppose it involves having the gateway operator setting up the route
>to me. no?

Usually not, especially if you work the gateway directly. It depends on
the routing techniques used locally.

Hi Ed,

At this time there is not a JNOS for windows. JNOS can be run in a dos box under windows, with some tweaking of the PIF you create. WG7J (the original maintainer of JNOS) indicated an interest in creating a windows application or driver. As I recall the discussion, he planned to create the low-level software, using existing applications for clients and servers. However he's also gotten married, and moved from a university setting to work in Japan, so when he might find time for this project is anyones guess.

>
>Thanks in Advance
>
>Suresh N9GSA

This isn't a direct answer. When I was working at AEA I modified an
IC-28A for 9600. It was probably the most successful of the PLL
modulated radios I've seen on the air. Unfortunatly this may or may not
transfer across to the '48.

The biggest problem with modulating the PLL is that it is constantly
trying to correct for the frequency error imposed by the modulation.
This causes the radios to exhibit a low-frequency roll-off and to tend to
wander around the center frequency, making data slicer decisions by the
receiving modem less accurate.

Unless you really need the high power (and with a good signal, you may
not), look at the TEKK radios. These are in the $150 class, crystaled up
and burned in on your frequency. There are probably 2 dozen of them in
use on the 3 440-MHz 9600 baud packet repeaters locally.

Hope that helps!

73, Bob

1176. Viterbi decoder package released

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-19 07:15:22 UTC
From: karn@unix.ka9q.ampr.org
Message-ID: <3kglma$h66@qualcomm.com>
Source record: 44356

As promised, I have uploaded my Viterbi decoder package:

ftp://ftp.ucsd.edu/hamradio/packet/tcpip/incoming/viterbi.tar.gz
ftp://ftp.ucsd.edu/hamradio/packet/tcpip/incoming/viterbi.zip

This package implements a coder and soft decision Viterbi (maximum likelihood) decoder for the rate 1/2 K=7 NASA standard convolutional code. It includes a driver program for test purposes.

The decoder runs at about 45.5 kilobits/sec on a 66 MHz 486DX2 under BSDI1.1 and gcc 1.42. (Interestingly enough, it runs only about 40.8 kb/s under gcc 2.5.8, even with full optimization). This is about 6.6x slower than my Fano decoder on a "clean" channel. But unlike a Fano decoder, which bogs down on a noisy channel, the Viterbi decoder runs at a constant rate even when the signal is very weak (though not without errors, of course).

Phil

1177. Cheap TNC 4 Beginner

1178. UltraPak 2.1

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-19 12:10:07 UTC
From: tim@cirrus.demon.co.uk
Message-ID: <795615007snz@cirrus.demon.co.uk>
Source record: 44358

Hi all.
Version 2.1 of UltraPak, the Windows 3.1 terminal program, is now
available from the ftp site ftp.demon.co.uk in the directory /pub/ham.
The file is called upak21.zip and is about half a megabyte.

For those who haven't met UltraPak yet, it is a full-featured Windows
3.1 or later terminal program which will drive most TNC's.
UltraPak up to and including version 2.0 was available only to TNC-2
clones. Version 2.1 has been modified to allow use with almost all TNC's.

New features in 2.1 include a simple script language, new user registration
facility, extra on-line help, facility to send commands to the TNC on
exit from the program as well as on startup, user-defined date and time
formats, much more flexible stream configuration, etc., etc.

UltraPak operates your TNC in TERMINAL mode, to ensure compatibility with
as wide a range of machines as possible. Up to ten separate Receive
Windows are completely configurable as to which stream is associated with
them and which stream-switch character is used.

Version 2.1 of course retains all the facilities which UltraPak is already
well known for, such as auto-splitting of the Receive Window, message
preparation facilities, YAPP protocol support, full on-screen information
at all times etc.

Try version 2.1 now - you'll like it ! In case of any difficulty mail me.
And let me know what you think anyway. Further development of UltraPak
will be guided by user-feedback.

Source record: 44363

chuck.chivers@wa_bbs.westonia.com (CHUCK CHIVERS) asked:

CC>I am looking for information about getting replacement parts for the Radio
CC>Shack discone scanner / ham antenna.

CC>I have heard that Radio Shack buys these antennas from another company. If
CC>this is true, who makes the antenna? I heard it was possibly Diamond.

I just looked thru my Ham Radio Outlet catalog and I did indeed find the
antenna listed in the Diamond section.

Also, in the AES catalog, Diamond antenna seems to be distributed by RF
Parts in San Marcos, CA. I suggest you call their number and see if they
can help you with this: 619-744-0900

The Discone antenna is shown as the D-130J in the HRO catalog. It isn't
shown at all in the AES catalog.

Best of luck!

WG7J and I had a discussion last June about this. I was in the process of writing
a NDIS->KISS driver for Windows NT and Windows 95. This would allow the
use of the native stack in the OS's for TCP/IP work, thus using standard WINSOCK
apps for clients/servers. The work is still in progress, however it has been slow
due to commitments to work and a few of us experimenting with SS and getting software
for that working. I am hoping to have it complete and running for SeaPac this June.

1185. TAPR BBSSIG Meeting Summary

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-19 18:54:26 UTC
From: barry@zeus.ia.net
Message-ID: <3khul2$of3@allanon.ia.net>
Source record: 44368

The following is a summary of the TAPR BBS SIG meeting in St Louis. Feel free to post this to the packet BBS in your area. PLEASE retain the BID.

SB TAPR @ USA $BBSIG_950311
TAPR.NEWS BBSSIG Meeting Summary

About 20 people attended the BBSSIG meeting in St. Louis, MO. This was part of the TAPR Annual Meeting.

This bulletin is presented as a service by TAPR, to inform and involve Sysops in determining good operating practice and working toward common goals.

With a small group, it was a nice opportunity to let each person speak about their individual concerns. Comments ranged through the usual Sysop issues. Under the category of long standing problems:
- newer Sysops reported problems understanding BBS docs,
- the size and quantity of header lines was mentioned, and
- problems with forwards to personal mailboxes (TNC built-in feature).

Several new items prompted some discussions. There was interest in having a msg type `E' for emergency traffic. A priority scheme would forward types E, T, P and B in that order. At least one BBS supports multiple msg types and most either forward according to priorities or can be configured to do so.

Regarding user interface, it seems that users spend a lot of time listing the large number of bulletins. The `L' command uses a lot of channel capacity. More efficient mechanisms need to be developed for users to list and search bulletins.

There seems to be little support for redistribution lists. This is the practice of sending multiple personal msgs rather than sending a single bulletin. It was not viewed as an effective use of the network.

For NTS traffic, it was suggested that the BBS prompt the user in a "fill in the blanks process". This would result in more consistent traffic and teach users to use proper formats.

In the area of future systems, brief mention was made of a few new topics being discussed in the Internet BBSSIG. Of great interest is the discussion of client/server programs. One feature these programs might incorporate would be capturing bulletins being downloaded to other users. In theory, each bulletin would be read only once and all

stations would capture it. This is the same scheme that AMSAT is using on the microsats.

Also getting a few comments was the thought of changing the format of the SUBJECT field on current bulletins. A set of standard topics would be created, similar to the newsgroups used on Internet. Users would send bulletins and include the standardized topics in the SUBJECT field. In the future, the BBS or client program would tag bulletins which meet the users interests.

The next meeting of the BBSSIG will be held on Saturday evening at the Dayton Hamvention. In order to provide some structure to the meeting, an agenda will be prepared and a number of specific topics will be addressed.

Send comments to the station that posted this bulletin in your area or to:
Barry WA0RJT @ WA0RJT.IA.USA.NA
or via Internet barry@ia.net

A no-frills approach would be a TAPR TNC-2 clone like the MFJ 1270-B or
1270-C, either of which are available in the used marketplaces (hamfests,
on-air swap nets, rec.radio.swap) for around $50.

Make SURE you get ALL of the documentation that comes with the TNC - it's
pretty much essential, for a beginner, in order to understand the various
bells and whistles that are available on your TNC.

As I didn't see your original article, I'm not exactly sure what the first question was that the reply that I am reading is based.

The frequency of 145.55 is an agreed simplex frequency.
According to the FCC rulebook, you have the whole frequency. But in the interest of other Amateurs, the ARRL has proposed a bandplan that is fairly universally accepted amongst even us non ARRL hams.
I believe they have goot tten a little too carried wa away
wih th their new bandplan which dedicates the frequencies between
145.50 and 145.80 for Miscellaneous and experimental modes.
What is Miscellaneous, What is Experimental. ?

In practice, and universally accepted, despite the ARRLs attempt to force more bankd dchanges down our throats, the frequency between
145.50 and 145.80 is allocated for FM simplex.

STIG - I think you missed the entire point. Use of equipmernt built by the
various manufacturers you listed is a viable solution for Part 15 users who
are not licensed. However, the use of the various spread sequence
algorithms is specifically prohibited in the amateur radio service.
Metricom's hopping is not neccesairly illegal for amateur use, but you need
one heck of a lot of intermediate repeaters to go 25 miles, so the

end-to-end throughput drops to very low percentages of the initial baud rate.

Therefore an amateur can't take advantage of the higher power levels HIS license allows on the 902-928 MHz frequencies by building an amplifier and still use the commercial Part 15 stuff. The combination of the ham's higher power and the commercial spreading algorithms would most certainly result in reliable PTP data links of 20 to 25 miles, but both the FCC and TANSTAAFL rule in this situation.

Source record: 44378

This can be filed in the "For What It's Worth" pile, but I thought I'ed pass this along for those who may not know.

I got JVFAX70 up and running this weekend and the received pictures were perfect. When I a created a test pattern and transmitted it, I got reports that the whole picture was shifted to the right. It was straight and true, but just shifted to the right a bit.

To make a long story short, John Montalbano KA2PYJ the creater of the ViewPort VGA SSTV software happened to be on 20 meters at the same time and heard about my problem. He called me on the Land Line to tell me that the problem was that the test pattern I created was 320 pixels wide, and JVFAX needs a picture 340 pixels wide. I changed the picture to 340, and it was received properly by other stations. So 340x240 should be the right size to scale the pictures at. There are 16 lines of Gray Scale transmitted before the 240 lines of picture so the will total will be 256 lines of SSTV.

I would have probably never figured this out if it had not been for John taking the time and expense to call me and set me straight. THANK YOU !!

Maybe the picture size is well known to most JVFAX users, but in case someone else might run into this problem I thought I'ed pass it along.

I'm getting started in SSTV, and would like info on frame grabbers to use with my CamCorder. I have heard a few folks talking about one made by Pasokon called the "RT".

If you have some info about cost, availability, functionability, ect. about this one or another type I'ed like to heard about it. I'm running JVFAX70 with a ViewPort VGA converter on a 386DX-20, but the frame grabber would be installed in a 486DX-33 that is also in the same room.

Thanks for any help

I am looking at doing the same thing too. If all you need is something
to grab the frame off of a camcorder, etc. and have a program to send
it already like JVFax, try looking at buying a cheap used video capture
board for your computer. These are being sold left and right (640x480
res with 16 million colors) over on one of the ibm hardware groups
that deal with "video" (I can't remember the name), but if you look
right, you might be able to come across one that is cheap (compared to
new...for maybe $100?????) with all the fancy software and everything.
Using one of these under Windows to save things out and running the
other program to send the picf can work out to be a cheap, effective solution.
If anyone has done this and has found that I am wrong...please let
me know, but I think it'll work.

I tried MSCAN but couldn't get it to work with my VGA display
adapter. It requires a configuration step in which you specify
your VGA card type. I picked the WD93... (don't recall exactly
right now) corresponding to the chip in my machine. Didn't work.
Tried installing a couple different VESA drivers known to work with
other applications. Picking the VESA choice in the MSCAN set up
didn't work either. The screen went mostly blank with speckles
and the machine started beeping.

If you want to receive SSTV images with the least amount of
effort, grab a copy of /pub/hamradio/pc/digital/atv/ezsstv.zip
from oak.oakland.edu.

=Mike= KC6YQO and others have been asking about where to get JNOS:

Try hydra.carleton.ca which has it, as well as a LOT of greatly
appreciated stuff for packet, particularly high speed.

But according to the readme.now document in the docs110i.zip file:

Latest sources can be obtained on Internet by anonymous ftp from among others:

pc.usl.edu in pub/ham/jnos
ftp.ucsd.edu in hamradio/packet/tcpip/incoming
mvangel.npt.nuwc.navy.mil in public/tcpip
mpt.et-inf.fho-emden.de in pub/hamradio/tcpip/jnos110
hydra.carleton.ca in pub/hamradio/packet/tcpip/jnos

They can also be found on several phone bbs systems, often shortly after
the release date. Here are some to try (all in the U.S.A.):

N8EMR's Ham BBS (614) 895-2553
ChowdaNet (401) 331-0334

1211. Turn off KISS mode in TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-21 16:41:59 UTC
From: ac408@dayton.wright.EDU
Message-ID: <9503211641.AA15271@wpdis01.wpafb.af.mil>
Source record: 44293

Wise TCP/IP packet gurus:
How do I take my new TNC out of KISS mode? Is there anyway to do that with a terminal program. I put the TNC into KISS mode using the terminal program with:

KISS ON
RESTART

The lights flash at me and when I start JNOS, it works fine.

After I quit JNOS though and try to use the terminal program again, it just stares at me. Is there a way to "reset" the TNC to non-KISS mode? I currently am having to manually (ie pull the power jumper on the NOVRAM) to reset the TNC.

My TNC is a MFJ-1278 (the original model, not the B version)

Any help would be appreciated. THANKS!!

The TAPR BBSSIG is sponsoring a working group to generate and distribute a series of information bulletins which will serve to instruct packet users in a variety of areas. These bulletins will be distributed via the packet network and can be retained at each BBS in a file area. An index will be provided to allow users to find information they desire.

If you are interested in actively participating in this effort and can work on a collaborative effort, please speak up. Send an email msg to:
barry@ia.net
or wa0rjt@wa0rjt.ia.net

73 Barry

Task List

Here are a few things that we need to do, somewhat in order.

1. Complete the outline. We need to define a structure that will last for at least a few years. Think about how many articles will go under each topic. What would you write to insert in each section?

2. Define a common format for distributing the materials as packet bulletins.

3. Start to write a few sections. This will build confidence in Sysops and Users as they'll see that something is coming out, not just an empty outline.

4. Schedule. I don't want this to drag on. We have to make use of the early enthusiasm from the team. It would also be nice to have something to show at Dayton. This is a great opportunity to build up this education idea and solicit additional members.

1215. TCP/IP with xt PC and baycom modem?

Newsgroup: rec.radio.amateur.digital.misc

From: p92022@cplab.ph.ed.ac.uk
Message-ID: <D5t1Gz.LAL@festival.ed.ac.uk>
Source record: 44301

Is it possible to run TCP/IP on an old XT pc, using a baycom modem?

I have tried using the ax25.com version 3 packet driver, along with jnos110h, which seems to load OK, but I can't receive anything.

The software seems to transmit, but on trying to connect up to a friend's station in ax25 mode, it caused his Baycom software to continually send out beacon idents.

I have also tried running the TFPCX baycom driver for superpacket, and have the same problem on receive.

Is it likely to just be a problem in my setup, or is the XT too slow?

Has anyone else got such a setup working on an XT?

Alison,

The XT might be a problem. You can run TFPCX with its own
terminal program and see if it works, you can also run it
in the diagnostic mode and hear if the computer chokes on the
TFPCX. Get the new version 2.10, there is also a english manual.
sp works fine with the TFPCX.

I have a baypac BP1 modem that appears completely deaf. It is a new unit and I have been careful to wire it correctly to the radio. Any ideas why it cannot even recognize when audio is being applied to it?
I am using a yaesu 530 ht
not that it matters.
Thanks for any help in advance!

1220. New Version of X1J

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-22 04:23:40 UTC
From: rrt0102@ibm.net
Message-ID: <3ko8oc$7lm@news-s01.ny.us.ibm.net>
Source record: 44302

I recently saw a posting somewhere about a new version of X1J (release 4.0, I believe). Does anyone remember seeing the announcement? And if so, can you tell me where to obtain the code? I have tried ucsd.ede and oakland.edu without any luck.

Thanks,
Michael Crowder

1221. JNOS 1.10i bugs?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-22 06:33:46 UTC
From: at738@FreeNet.Carleton.CA
Message-ID: <D5twwB.86@freenet.carleton.ca>
Source record: 44303

Are there known bugs in 1.10i? I compiled a new copy of it this morning
and the re-transmite timers are totally outta wack. I'm waiting at times
up to 3-4 minutes before it re-tx. I reload the old version of jnos 1.10g
that I've been running and it's ok. Some reason version 'i' is not reading
the correct figures from the autoexec.nos file.

Anyone know what's going on?

Hi All,

I was wondering if anybody else is building or has built N6GN's 2 Mbps Microwave Link? I am currently in the process of construction. It would be nice to talk to some other people who have done this, or are doing this.

Glenn Elmore - n6gn has been very helpful to me, but I would still like to hear from anybody else trying this project, to compare notes, etc.

Thanks,
Rich - n9pix

From: micah@community.net
Message-ID: <3kolev$qg1@odin.community.net>
Source record: 44305

I own a Baycom TNC that tiger tronics sells, if I remember right it cost me $50.00 I currently use it, and I have allmost all of the bugs worked out. I give it my whole hartfelt endorsement. I will admit that I did have some problems with it at first but I received excelent help from the support person at tigertronics. This is my first TNC.

It took me a few tries to get my connector wired right to my Radio (I use a HTX-202) and I found that the operating system that came with the tnc for my computer had a couple of small bugs in it, (some of the commands were programed wrong, the good by text was the welcome text and visa, versa. But easly worked around).

I found that the Baycom TNC to be a pretty nice TNC for what it is. (a no frills TNC) I thnk that it is best to use the software that comes with it.

If you do decide to purchess the TNC and have a few questions. Feel free to ask them.

First of all make sure your running the JAN 93 AX25 version, the other are
buggy. As for the speed in the XT is most likely the problem. Since those
drivers really need the cpu and it's interupts. It's likely that the XT
sis just alittle to slow to handle the needs of the drivers.

At what speed is the XT running? Is it one of those REALLY old XT running
at 4.77 mhz? Or if your luck and have the 8/12 mhz one then I'm sure you
can get it working. Why not post the switches your using to setup the
ax25 driver. Since I'm at work now I can't port what I have, since it's
been awhile since I've taken a look at the batch file.

1225. NET_Mac2.3.49.sea.hqx.text

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-22 10:47:12 UTC
From: adam@iag.tno.NL
Message-ID: <9503220847.AA02353@iag.tno.nl>
Source record: 44307

The Netherlands, March 22, 1995.
Hello dear reader,

Today I distributed NET_Mac2.3.49.sea.hqx...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac I implemented the following:

- Fixes for 'axtext [<message>]'
- Fixes for 'nrtext [<message>]'
- Tailored some error-messages
- Set minimum T2 timer to 250 mSecs. 1000 was too high for 9600 bps
- Allow double-quotes in ftpusers-file. Needed for like: "John's HD"
- Fix for 'route add default ..'. I hope it works better this way
- Support new command 'route window <hostname>'

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim archives.

The new NET/Mac has (hopefully) been uploaded to:
ftp.ucsd.edu, to the directory hamradio/packet/tcpip/incoming.
If it's not there then look at hamradio/packet/tcpip/mac.

Scott WY1Z may have also uploaded the new version to:
oak.oakland.edu, to the directory pub/hamradio/mac/digital.

NET/Mac will be uploaded to PI8HVH.AMPR.ORG, directory public/mac.

Adam PA2AGA (e-mail: adam@iag.tno.nl)
(or: pa2aga@iag.tno.nl for letters only, NO BIG files here)

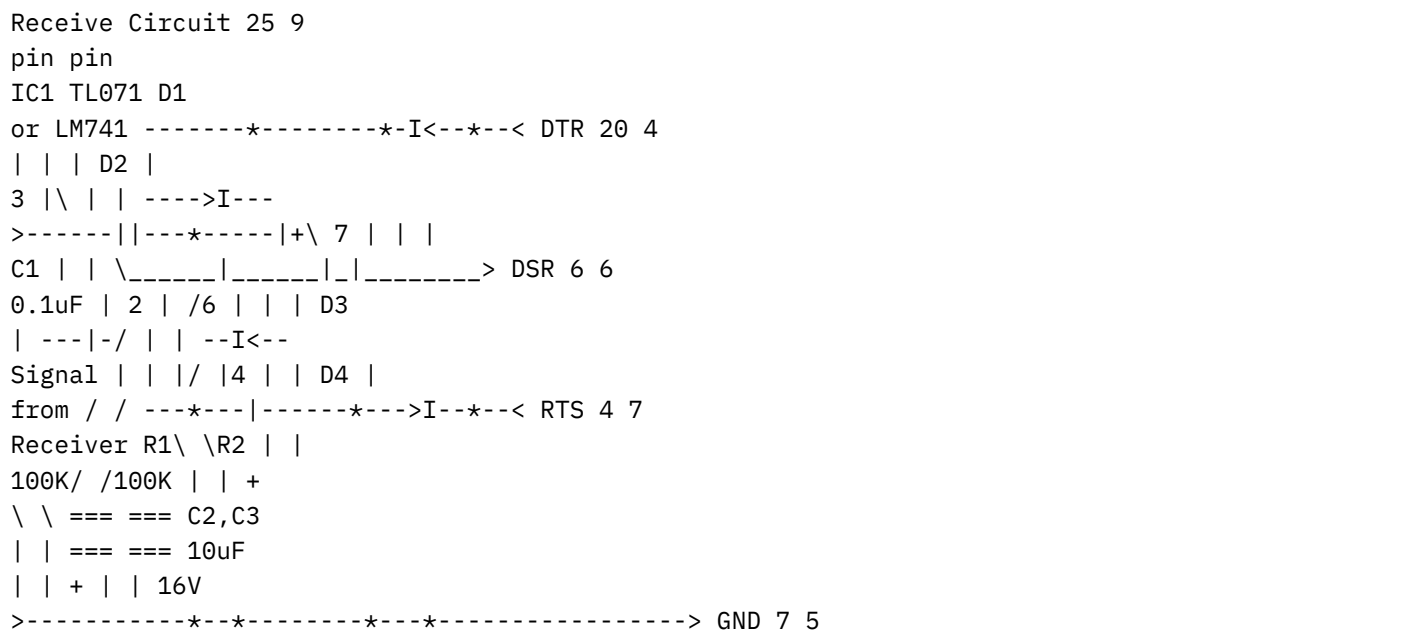
>circuit; in the manual the PTT circuit is supossed to be omited to receive
>only.

I am sorry for the confusion. The schematics in the online help is just
a bit more compact to give a better overview, electrically they are the same.
The manual is in the file HC.DOC. Print it and take a look at page 36.
For receive-only operation you just need the first part:



>What is a PTT circuit? Which circuit should I build to receive only?

PTT means "Push To Talk" and refers to the switch at the microphone you
push to activate the transmitter. This part of the schematics is only
required if you want to transmit, so forget about it.

1229. PACK*BASH at the Dayton Hamvention

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-22 14:30:07 UTC
From: John Ackermann <john.ackermann@DaytonOH.ATTGIS.COM>
Message-ID: <D5uIy7.FLL@ranger.daytonoh.attgis.com>
Source record: 44310
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.info

Attending the 1995 Dayton Hamvention? Then don't miss out on PACK*BASH!

What?
A new event for the digitally-inclined ham, featuring:
* Buffet dinner (with cash bar)
* Nationally-known speaker holding forth on a current topic
* Prize raffle
* TAPR special interest group meetings
* "Bird of a Feather" gatherings

When?
Friday evening, April 28, 1995
Dinner starts at 7:00 pm
Speaker at 7:45
Meetings to begin after the speaker

Where?
TJ's Restaurant
2462 Dryden Road, Dayton
(Dryden Road exit, I75 -- across from the Holiday Inn)

How?
Dinner requires advance registration and payment BY APRIL 24th, 1995.
Seating for dinner only is limited, so register early! The cost is
$16.00 per person, tax and tip included.

All amateurs are welcomed to attend, enjoy the speaker, and
participate in the meetings, although only those purchasing dinner
in advance can eat.

To register, contact:
PACK*BASH
c/o TAPR
8987-309 E. Tanque Verde Road #337
Tucson, AZ 85749-9399

Phone: (817) 383-0000
Fax: (817) 566-2544
Internet: TAPR@TAPR.ORG

Visa/Mastercard Accepted

Who?
PACK*BASH is co-sponsored by TAPR -- Tucson Amateur Packet Radio,
the national leader in digital communication -- and the Miami
Valley FM Association, Dayton's packet radio club.

For further information, contact TAPR, or email packbash@ag9v.ampr.org or BASH@N8ACV.#DAY.OH.USA.NOAM

1230. Updated software for PMP (poor mans packet)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-22 14:36:26 UTC
From: ed@fore.com
Message-ID: <3kpcla$smr@shell.fore.com>
Source record: 44311

I build an external modem (2 chip design) for the Poor Mans Packet and hooked it up to my pc parallel port. It works ok except for 1 thing, when its receiving data either to me or another operator it locks the keyboard. This makes it a considerable pain to try to do anything when the local bbs has 3 or 4 operators on at once. Any traffic on my freq and the keyboard goes dead until the freq is clear.

I would hope that there is a new version of software that will correct this problem.

Any input us useful.

Please Email Ed@fore.com

Thanks

Source record: 44317

In response to a recent discussion carried on by the gallant heroes
of the NOS-BBS mailing list (putting the `know' into NOS), I've
written a short item on the pitfalls experienced in marrying
a Kantronics KPC9612 `tnc' to a Kantronics DVR 4-10 `data radio'
for use by JNOS or a G8BPQ Node.

Tapr have been kind enough to accept it at:

ftp.tapr.org as /tapr/general/9600baud/kan9k6.txt (Thanks Bob)

The internetually challenged can take their chances obtaining it by
sending a blank message to kan9k6@lightfox.demon.co.uk

N.B. ampr.org hosts may have trouble receiving a reply

Cheers,
Gareth.

Hi George.

I have it at 1:117/3000, however that is an -unpublished- node. If you will wait until tomorrow, I think I can get it to 117/130, Dave Tilley of our humble net 117 in R19. I think I can get him to post it for FREQ He carries my files for freq that come off 117/3000 for how to get stuff working in DOS VDM sessions in OS/2 and also on how to run voice/fax/data all on one phone line with the Zyxels in OS/2 DOS VDM sessions.

When I get off here, I'll net mail Dave and file attach it to him. If he sees it and gets to scan it, he may have it up and available before the weekend is out.

I own the Diamond discone antenna and it is not the same as the Radio Shack model. The Diamond antenna has a low band vertical element sticking straight out of the top, it also has an "N" connector. The Radio Shack antenna does not have this element and uses a PL-259. Just be sure about what you order before you do so.

Look for it at :

ftp.ucsd.edu
/hamradio/packet/tcpip/incoming

I forget the correct file name but I thinkit's docsi.zip or something like
that, there is a file jnos110i.txt that tells you what all the files are.

Yes, it is for 1200, but there is also a 9600 version, that plugs into
the printer port. there is the Baycom software for AX25, ver.1.5
if you prefer other software there is a resident driver TFPCX, ver.2.10.

There are also TCP/IP drivers around.

Could you please give me some specific info on where to look in the surplus
market?
Here at UT we mostly work at millimiter and sub millimiter frequencies. We
have a giant .6 MW CW source at 60 GHz for plasma heating, and various low
power instruments at 60 to 1000 Ghz, both optical and waveguide. The low
frequency (10 - 30 GHz) stuff I am now interested in is for a new plasma
reflectometry application.
Thanks in advance, Pepi Cima

1250. Re: New Version of X1J

>the announcement? And if so, can you tell me where to
>obtain the code? I have tried ucsd.ede and oakland.edu with-
>out any luck.
>

The new version is complete and I have started to upload it to a couple of sites. The main upload site I used was ucsd.edu. Unfortunately, it is still sitting in incoming (don't try to get it from there, files uploaded to ucsd.edu are not visible until moved out of incoming). I have been waiting until it was moved and has appeared on the numerous mirror sites before actually announcing it. It is on a couple of other sites also but bandwidth may well be limited. If anyone knows the ham admin person at ucsd, perhaps they can have a word....

Anyway, it is also on the following

site where
==========
ftp.hereford.ampr.org \incoming
wb3ffv1.sed.csc.com \incoming\thenet
ftp.tapr.org \tapr\software_lib\UPLOAD\thenet

It is likely that the admin of those sites may move the files to a more appropriate area.

If the sites get congested, please check ucsd mirrors to see if it has appeared there. I will continue to try to put it on ftp.funet.fi but at the moment funet is a tad busy - I suppose this is due to the recent release of linux 1.2.

If anyone puts it elsewhere, post the fact.

It comprises of the following files

NAME SIZE DESCRIPTION
==========
X1J4TNC2 ZIP 426461 TheNet X-1J4 for the TNC2
HOTNCOLD ZIP 24915 Details for adding temperature sensors to a TNC2
X1JDEV ZIP 107102 Details for adding a deviation meter board to a TNC2
X1J4PK96 ZIP 422132 TheNet X-1J4 for the PK96
X1J4-SRC ZIP 252880 The source tree for TheNet X-1J4

TheNet is an Amateur Radio Packet Switch for non commercial application only.

Here is the INTRO.TXT file from the release :

INTRODUCING TheNet X-1J Release 4

This version is a modification to TheNet X-1J release 2 and
includes a small number of changes that I had promised.
Specifically the changes from TheNet X-1J release 2 are :

* The buffer loss problem has been fixed
* The ARP table is automatically updated from ARP requests & replies
* The node maintains a second heard list of L3 Netrom nodes that
gateway through the node
* The RxDeviation & Smeter ADC channels may also be used as
arbitrary inputs instead
* A bug in the copying of digipeated frames in KISS mode 2
has been corrected
* A defensive port flush function has been added
* Link list integrity checking has been extended to check
reverse links
* A bug in handling of BBSALIAS, HOSTALIAS and DXCALIAS has
been fixed
* The USER list shows circuit choke status for patchcord
connections.
* BBS, HOST and DXCLUSTER are cleared properly on cold start
* The ADC* text messages may be up to 12 characters long
* The ACL checks the end user call as well as the node call
in accepting connections.
* A default IP route entry may be made.
* Lines that start with a '#' are ignored by the switch.

The ARP table is managed by sending ARP requests and by
monitoring ARP messages received. The BBSALIAS etc commands
were compromised by the inclusion of the TexNet interface and
have been corrected.

The L3MHeard command controls a second heard list. It shows
each station that passes Net/Rom frames to the node for
gatewaying. Each entry shows the time since last gateway,
port, frames heard and the callsign of the last destination
node that the sending node was sending to.

The USER command has been enhanced to show, for each
patchcord entry, whenever one or other circuit has been
choked.

If one or other of the ADC channels used for measuring RX
Deviation or signal strength are not required for those
purposes, they may be used for other purposes in a manner
similar to the other 2 ADC channels.

A menu driven windowing patch utility with context sensitive
help is included.
Utilities for printing passwords in a sysop-friendly manner
and a utility for changing the help text attributable to John
Bednar WB3ESS are also provided. Modifications for the
MFJ1278C by WB0YRQ are included in the bankswitching details.
A utility to manage the node configuration by N8PTT is

included.

The previous releases introduced the following :

An S-meter function in the heard list
A Voltmeter function for the other two ADC channels
Support for the TexNet '*** LINKED to' syntax
A bug fix to the BBS, ALIAS and DXCLUSTER commands
The ability to change the user's command prompt list
The ACL function has had a feature added to speed it up
A complete IP router,
The Receive Deviation meter,
Control of 'Slime Trails',
Information text messages 160 characters long,
Multiple line INFO, CTEXT and BTEXT messages,
Nodes broadcasts occur 60 seconds after power up,
Optional reconnect to the node after remote disconnect,
PARMS, MODE etc may be managed by offset & value,
Digipeat uplink & downlinks may be selectively enabled,
Level 4 retries (min) is now 1,
An MTU command allows MTU settings to be changed for IP use,
Node alias handling is optionally case sensitive,
TALK will optionally pass 8 bit data,
The RESET bug in versions prior to TheNet X-1J has been cured,
The ability to remotely set the node's alias,
The ability to listen for 3 extra aliases & invoke BBS etc,
Selective node broadcast control for 'hash' nodes,
A UI command to send arbitrary UI commands,
Access control list capabilities,
Multi-user conferencing (the 'TALK' command),
A CWID keyer,
Better SYSOP authentication,
MHeard list showing callsigns, packets heard & time since last heard,
MHeard list shows whether a station is a node and / or TCP/IP station,
A Closedown command to remotely shut the node down,
A DXCluster command that operates like the BBS & Host commands,
A Btext command to set the node's beacon text message,
A Ctext command to set an optional alias connect text message,
The ability to enable or disable any command,
Improved command prompting with only valid commands shown,
Routes show optionally as alias:callsign or callsign alone,
Additional control over system reset,
KISS as an alternative to the crosslink protocol,
Hardware handshake controlled host mode operation,
MODE command for configuring additional parameters,
BBS command to auto connect to a remote BBS,
HOST command to auto connect to another BBS or Host,
BYE or QUIT commands to disconnect,
STATS command to display internal statistics,
MANAGER command for system manager access,
AUDIT command to set system audit levels,

Bug fixes (e.g. info messages too long crashing the node),
Changes to the NODES command,
An improved nodes broadcast algorithm for the crosslink port,
Split port nodes broadcast intervals,
Ability to enable & disable nodes broadcasts selectively on each port,
CQ apologises nicely if disabled,
Most Escape commands have been replaced with MODE parameters,
Beacon messages may be digi'd,
CALIBRATE command for remote checking of Tx deviation,
LINKS command to show current level 2 links,
Configuration of the beacon period,
Auto routing of 'connect' to either BBS, DXCluster or HOST,
Remote dump of entire neighbour lists for all nodes.

NEWSFLASH :

The default IP route facility was a last minute change. As a by-product of
doing it, the operation of the IProute command changed. If you make an
entry in the iproute table for port 0, it will display the whole table
not just the line entered. I'll correct it next time round.

Also, one of the beta testers reported yesterday that a CTEXT / BTEXT line
loner that the maximum 79 characters caused a problem. It has not been possible
to duplicate this so far and I can find no bug, but beware.

Finally, the code has been improved to fit into the space available. As a result,
the idle loop counter will show it running about 25% faster. This does not mean
however that everything is that bit faster ! Interrupt handlers are unchanged.

In putting up a new 9600 baud link here locally, we are now at the stages of fine tuning parameters. Both ends of the link are TheNet X1J nodes, and are the only stations on the frequency. Has anyone figured out a set of optimal X1J parameters for a link like this? Anyone done any serious tweaking of X1J nodes at 9600 baud?
I would welcome any recommendations anyone might have.

I need to store separately in a computer data and audio of an RDS signal.
Where can I find the electrical scheme for a RDS radio receiver?

Does exist a device or a kit for building an RDS receiver that split radio
signal in data signal and audio signal and with two output:
one for data and one for analog audio.
The best for me would be a device that I can interface with the computer
through the serial port for data and input jack for analog audio.
Please answer with e-mail.
Thank you very much.
Nicola.

The AZ mailer does work but its slow since it has to split & UUencode the
zip files into 11 (text) messages. Try ftp to cfcsc.dnd.ca and look in
the hamradio directory.

1267. Yeasu FT-5100 Data Port With KCP3

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-25 00:05:38 UTC
From: MKFR00C@prodigy.com
Message-ID: <3kvmoi$146q@usenetp1.news.prodigy.com>
Source record: 44245

Hello,

I'm trying to figure out how to hook up my Kantronics KPC3 to the Data Port on my Yeasu FT-5100. I have tried a few different ways from using the manual for the radio and TNC and everthing I have tried is not working.

73, Jon

D>73 Ray AD4RR

You couldn't have done it right then as there have been over 238
requests and the ones that have rejected I've seen have all been
submitted incorrectly. Most had two periods before the ZIP wrong
spellings etc.

Don't feel bad.....I *NEVER* got it to work in the last 2 years with
a PK-96 and a MFJ-1270. I eventually pulled the RX off the data port
and the TX off the front panel mic connector. Works great now.
Go figure.....

DRSI made a board, P/N DCD3105, sold for around $30. Functionally you
can get the same thing from TAPR at 817-383-0000 for $15 or $20.

Not sure about that model, but the KPC-3 requires sending 192,255,192
sequence from a terminal program. Most DOS programs will allow you to
do this by:

1)hold down ALT key
2)type in 192
3)release ALT key

4)hold down ALT key
5)type in 255
6)release ALT key

7)hold down ALT key
8)type in 192
9)release ALT key

Then perhaps hit enter, depending on the terminal program.

1280. KPC-3 and DR-1200TH2 wiring?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-25 22:05:28 UTC
From: Kenneth.E.Harker@Dartmouth.Edu
Message-ID: <3l2438$p03@dartvax.dartmouth.edu>
Source record: 44261

I am trying to hook up my trusty KPC-3 to a new Alinco DR-1200TH2. I know
something is wrong, but I can't figure out just what. The TNC worked fine
when I had it hooked up to an Alinco DJ-580T. Here are the symptoms:

- Receives everything fine.
- When I transmit, it sounds like (from what I can hear on my HT) that the carrier is being opened, but no data is being transmitted - like if you held down the PTT button but didn't say anything.
- The J2 jumper in the TNC is not set.
- The radio and TNC are right next to my 14" monitor, but the monitor shows no visible effects when the radio keys up.

I think the problem is most likely in how I wired the TNC<->Radio
cable. Alinco gives you a cable with the Radio end soldered properly,
and a color-coded end for the TNC connector (a DB9 in my case.) The
circuit is essentially:

```
Radio pin TNC pin
--------- -------
1 AFSK from TNC to Radio 1
2 PTT line 3
6 receive AF from Radio to TNC 5
7 Mic shield/ground *
8 ground 6
```

Now, the part I'm having trouble with is *. Line 7 from the radio does
not go to any pin on the DB9 - it goes and forms a circle around line 1
somewhat like:

```
___
/ \
-------------|--------------- Pin 1
/ \ / TNC
| _______
| |
| |
| |
Pin 1 Pin 7
radio radio
```

So what do I do with the line coming from pin 7 on the radio connector?
I've tried leaving it unconnected - no TX. I've tried connecting it to
pin 9 on the TNC connector (same common ground as pin 6 and 8) and
still no TX. Neither the Alinco manual nor the KPC-3 manual are any

help.

Has anyone out there wired a similar setup - or does anyone have any ideas?

OK. I have my setup working now. After a more further investigation, it turns out that the AFSK output was too low, and required tweaking via a potentiometer and jumper in the TNC board. But I am still curious as to what
the diagram for line 7 means? I currently have it connected to the TNC's common ground, and it works, but what should it be connected to, anyway?

1284. Tell me a good reason not to throw out this TNC to the trashcan.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-25 23:13:03 UTC
From: papo@briscas.ctt.bellcore.com
Message-ID: <3l281v$463@athos.cc.bellcore.com>
Source record: 44265

Howdy:

I'm really upset. I've been tinkering with this)(*&_(* TNC and
I am about to take it apart and connect it to the first
high voltage transformer and melt it.

I have this TNC, an MFJ-1274 with an HTX-202. Thanks to you guys,
I was able to construct the cable. So I made the cable

```
MIC -------------------|
PTT----- 1.0K----1.2K--+---- mic tip (RS did not have 2.2K available :( )

RX------------------------- headphone tip

GND -----------+----------- mic shield
|------ headphone shield
```

PTT is being pressed ok, the same goes with the receiver. I'm receiving
all the signals very well, now when I'm transmitting, that's where
the problems begin.

I tried to calibrate the TNC, following MFJ's instructions for direct
connection. Well, the calibration signal is only faintly heard
all the time. I can turn the R76 var resistor either way
and the thing is faintly heard. The most incredible thing
is that signals that comes from outside the room are received stronger
on my monitoring scanner than the ones from the HTX-202 which is in
the same room!!!! I already turned off the save and I'm shure that
is working simplex.

I've checked everything, I have use the Ohmeter to check if all the
connections are being passing through, everything fully deflects
the meter.

I migh try to plug the HT to the 2.5 Amps PS which is sold by RS, because
I'm trying this with the battery pack (freshly recharged..). But before
spending the money on that, I rather try with the pack first (if it is
not the cause of the problem which I do not know what it is anyway.)

I'm on a brink to send the TNC back to MFJ, but I might try to explore
other alternatives before doing it.

Please bear with me, I am not a happy camper. :(

Regards,

The ADRS Web Pages describe and give information about the ADRS, its publications and services, and contain what is now probably one of the most complete set of hyperlinks connections to other amateur radio related WWW sites and related Internet sites worldwide! You are invited to visit the ADRS WWW Pages at: http://www.iea.com/~adrs to learn more about ADRS and as the best starting point for exploring amateur radio on the Internet! To use the ADRS WWW site, you need will need an access to the Internet which permits you to use Mosaic, Netscape or a similar Web Browser which provides HTTP (Hyper Text Transfer Protocol) capability. (The new Prodigy Internet WWW Web Browser was tested and performs well.)

It's a nice start, but most of the documents are .ZIP files, which i can't read (at least, not very easily) on a Mac, and 'man -k zip' doesn't tell me how to do it on a UNIX box, either. So:

Click here now to download a series of 26k zipped text files with basic information about how to implement such a gateway!

is of no help to me. If files are to be compressed, please use a widely available or understood tools, such as the GNU software, as is done by folks with the U.S.G.S. for the FTP'able map data. Please don't assume an MS/DOS platform!

From: slm@world.std.com
Message-ID: <D60yLJ.Hn2@world.std.com>
Source record: 44270

Greetings! Can anyone point me to a place where I can find a map
of the packet network around the New York City/Long Island area?
The K1UGM local NTS BBS here has maps of New England, but I don't
know where to find a map to get into NY. Ideally, I'd like to be
on TCP/IP packet here in the Boston area, and somehow connect to
a node on Long Island.

My father-in-law just got his license (age 64), it would be fun
to chat "real-time" if we can find a "meeting place" somewhere.

Thanks!

Would like to know if anyone has seen a device that could be used
as a "Wireless Door Bell" perhaps triggered by light (beam breaking)
with a range of approx. 500 - 1000 feet.

any info would be appreciated, perhaps e-mail to laptosg@cadvision.com

Thank You

Thanks for taking the time to read this.

A group of locals need urgently a NOS package for DOS to setup a
gateway in Launceston.

The NOS should be able to handle ethernet, slip PPP.
Should handle TNC on a serial line or PCP card (HARPN, DRSI) etc.

If you have a late or latest copy please send mail to me so I can arrange
it delivery.

Please direct replys to mulga@clarie.apana.org.au
or robroy@clarie.apana.org.au

Thanks in advance

John VK7AD

One possibility is that there is a <yourcall>.lck file in spool\mail

I think it's a lood idea in your startup batch file to delete
all *.lck files in spool\mail and spool\mqueue

Cheers,
Gareth.

1293. KaGold download problem

From: jdy18@aol.com
Message-ID: <3l42jo$srr@newsbf02.news.aol.com>
Source record: 44276

I have tired to download the demo program for KaGold several times. The download seems OK but when I try to run the program, I get an insufficient memory message. Since I'm using a machine with 8 megs of memory, it seems like this shouldn't happen. I wonder if anyone has successfully downloaded this program (KAGOLDTD.EXE) and used it? I wold like to try it before I decide whether to buy KaGold.

Source record: 44277

Does anyone know of shareware programs available for the Kam Plus.
Requirements are that the program must allow use of the HF and VHF ports
simultaneously and it must run on an 8088 with a single 720K floppy drive.

You need a 0.1 to 1.0 microfarad cap in series with the mic line like I have added in to you drawing.
If you ude a poloarozed cap, make sure the positive is towards the radio.

The Mac program "Stuffit Expander" by Aladdin will unzip dos files just fine (drag and drop). Also, "Unzip" and "Zip-it" work as well & "Bbedit" will allow reading/writing in Mac/DOS/Unix format.

All of the above are available on most Mac internet sites.

From: wa6ube@aol.com
Message-ID: <3l5dso$asj@newsbf02.news.aol.com>
Source record: 44283

I have a Kantronics KAM unit - and yes, you can specify any shift you
want.
850 and 425 shift are older standards and are still in use with some HF
commercial stations (utils) .. 170 hz shift is pretty standard now on
amateur HF ..tho I have QSO'd some stations running 200 Hz shift on HF ...

with the KAM unit you can also specify the mark and space freqs
individually in
1-Hz steps .. for a non-standard shift i.e instead of the command:
cmd:rtty 170 ; or cmd: rtty 425
---
you can enter a specific mark and space tone pair as follows:
cmd:mark 1000
cmd:space 1170
cmd:shift modem

I have a sunair GSB900DX military HF radio and I run 1000 Hz mark
and
1170 Hz space tones
using the " cmd:shift modem " command allows for this ...

[]
I don't know about the software, but there are several chips available that do RS232-TTL; the best known is I think just the 232 (MAX232 from Maxim, AD232 from Analog Devices [which was actually the cheaper one a few years ago, to my surprise!], and so on). This provides 2 channels of 232-TTL and 2 of TTL-232, AND runs entirely from +5 V (it provides its own voltage supplies - no inductors either, just 4 capacitors).

From: dabloodgod@aol.com
Message-ID: <3l6j3e$g6b@newsbf02.news.aol.com>
Source record: 44288

The problem is that the output impedance of the 5100 data port is really really high - so the resistor in the kpc-3 swamps out the signal - I simply removed the resistor from the board in the kpc-3 - and it works great - for the last couple of years or so.

Good luck and 73's de Dave, kd6pro.

1304. TNC-2 Problems

Source record: 44190

I dug out my old TNC-2 over the weekend, and tried to hook it up for the first time in about 5 years. It connected to itself just fine in the digital loopback mode, but when I tried to put it "on the air" it wouldn't work. I tried to connect to a node I found on 145.01, and listened on a second receiver. It sends one long burst of what sounds like a packet with very little tone variation, and then resets itself, sending the startup screen to the terminal program. I'm running a copy of Paket6 I picked up off TAPR's server, and am using a Kenwood TM221 which I used for packet before. Any idea what's going on?

Source record: 44195

A new hamfest called HamRadio 95 is coming to Atlanta on April 7-8-9,1995. To be held at the North Atlanta Trade Center off I-85 and Indian Trail, the show promises to be a good one with all the big major commercial exhibitors in attendance on Saturday and Sunday. Hundreds of flea market spaces will open at noon on Friday.

To be held concurrently will be DXPO 95, a DXers delight sponsored by the Southeastern DX Club. A full track of forum speakers includes Al Hernandez, VP8SGP who has just have returned from South Georgia Island. Tony DePrato, WA4JQS, of the Peter I expedition and many other famous DXers will be speaking and in attendance. A DXPO hospitality room will be open for business at 8 PM Saturday. A DX Breakfast will start at 8:30 AM on Sunday at Shoney's with Bill Moore of the ARRL DX desk as the speaker.

Bob Grove will be a featured speaker at a Saturday SWL forum. Other forums include a QRP forum with Paul Carr, N4PC, CQ author, and Packet with Buck Rogers, K4ABT, also of CQ fame. This convention will host a number of representatives from the ARRL including Rick Palms and Frank Butler. A section called the Radio Zone will be for youth and will feature Cynthia Wall, KA7ITT, author of Night Signals. Don Miller, W9NTP, will be the featured speaker at the ATV forum on Saturday afternoon.

QCWA, SERA, MARS, the FCC, ATV, and the SE Antique Radio Society will also be topics of discussion and presentation. For further information, call 404-518-7376 or fax 404-642-9035. Dogwoods are in bloom, so join us for HamRadio 95!

1312. Periodic Announcement - TAPR Information and Internet Access

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-27 21:39:51 UTC
From: gjones@tcet.unt.edu
Message-ID: <3l7bb8$u9@hermes.unt.edu>
Source record: 44196

Periodic Announcement - TAPR Information and Internet Access

Greetings from TAPR!

TAPR can be reached via the Internet. The Automated Information Server that TAPR provides allows anyone to request information on TAPR, products, newsletters, and lots of other files. To find out more about this service, send an e-mail message to listserv@tapr.org with the subject line "Request" and the following text in the body of the message:

help (for a brief set of instructions)
index -all (for a list of all file by topic area)
list (for a list of TAPR Mail Groups)
get tapr taprinfo.txt (or info on TAPR)

In the above message example, "help" retrieves a brief set of instructions for info, "index -all" retrieves a list of available files by topic and "taprinfo.txt" retrieves a text file containing information on TAPR and what TAPR is all about. If you want to retrieve several text files with one message, use a separate line for each "get filename" request.

General Information:

* Ever heard of a TNC ?

* Interested in general packet radio information?

* Interested in high-speed packet operations?

* Interested in other types of digital communications?

* Interested in experimenting or building kits?

* Interested in keeping up-to-date on national digital and packet issues?

Then you might be interested in TAPR!

Goals:

% Support Research and Development efforts in the area of amateur digital communications

% Disseminate information on packet and digital communications

% Provide affordable and useful kits for experimenters and hobbyists

% Pursue and help advance the amateur art of communications through publications, meetings, and standards

History:

If you have used a packet radio TNC, then you are already a part of TAPR history.

The TNC (Terminal Node Controller) project grew from a discussion in October of 1981 at a meeting of the Tucson Chapter of the IEEE Computer Society. A week later, six of the attendees gathered and discussed the feasibility of developing a Terminal Node Controller that would be complete and available to amateurs at a modest cost. This was the genesis of TAPR.

On June 26th 1982, Lyle Johnson, WA7GXD, and Den Connors, KD2S, initiated a packet contact with the first TAPR unit. The project progressed from these first prototype units to the TNC-1 and then finally to the TNC-2 which is now the basis for most amateur packet operations worldwide.

TAPR was founded in 1982 as a national organization with interests in the areas of packet and digital communications. Today, TAPR continues as a membership supported non-profit amateur research and development organization. TAPR currently has more than 2000 members, worldwide. TAPR continues to develop kits for the amateur community and is working actively on publications and communications standards.

Membership:

Membership in TAPR includes a subscription to the quarterly published Packet Status Register newsletter. PSR has been published since 1982 and is recognized as an authoritative source for up-to-date user and technical information on packet radio. Much of the material in PSR is timeless. Back issues may be obtained from the TAPR office. Membership in TAPR is $15 for one year. In Canada and Mexico membership is $18 and outside North America they are $25.

Join the amateur digital-revolution -- Join TAPR!

Special Interest Groups

TAPR maintains several SIGs in various areas. To get the latest list of SIG groups, send an e-mail message to listserv@tapr.org with the subject line "Request" and the following text in the body of the message:

list (for list of mail groups on TAPR.ORG)

To request the information on any mail group, send an e-mail message to listserv@tapr.org and in the message text include:

information listname (where listname is the name of the mail group)

When you are ready to subscribe, send e-mail to listserv@tapr.org with the following command in the message text:

subscribe <list> <your name>

List should be the name of the mail list you want to join and Your Name
should be both your First and Last Name.

Current SIGs include:
NETSIG Regional Networking SIG
BBSSIG BBS SIG
HFSIG SIG on HF Digital Topics
DSP-93 SIG for those that are building TAPR/AMSAT DSP-93 kits
APRSSIG SIG on APRS

Other Lists include:
ARRLCAD Dicsussion group on ARRL design software

FTP users

The TAPR Software Library is now available via anonymous FTP. You can
access the library by ftp access to 'ftp.tapr.org' in the directory
/tapr. Login in as 'anonymous', with a password of
'your_account@internet_address'.

Packet Raido and TAPR is on the World-Wide-Web!

The series is accesible through the Packet Radio Home Page at this
URL:
http://www.tapr.org/tapr

What's here? A page of links (the Home Page), the TAPR Home Page, a page of
Packet Pioneers and Contacts, a hypertext packet primer and FAQ, and more.

Thanks to Howie, N2WX, for his support and invaluable contributions of
the TAPR page.

1313. Re: Packet-Internet Gateway ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-27 22:11:38 UTC
From: heinecke@cs.unc.edu
Message-ID: <3l7d6q$mjo@ashe.cs.unc.edu>
Source record: 44197

On the subject of packet-internet gateways..

I am planning a cross canada bicycle tour this summer. I have been encouraged to post my progress to rec.bicycles.rides. I will be carrying my 2m HT, some kind of palmtop machine (with at least a text editor and a communications program/port) and a pocket packet modem.

I'm looking for gateways through which I can either send reports to friends to post to the newsgroup, or gateways through which I can post directly. Since the packets will originate from Canada, I don't know what kind of addressing issues I'll face, either. I'm aware of gate@wb7tpy.az.usa.na and I assume that most BBS's I can connect to in Canada will be able to figure it out....

Any others? And any knowledge of how to post to a newsgroup?

>the same room!!!!

I don't know what MFJ's instructions are for calibration; if you're using another radio to listen to the transmitted signal, there's a chance you're simply overdriving the front end of that radio. That would also explain why other signals are received stronger.

Try either transmitting into a dummy load at lowest power, or using a dummy load on your receiving radio's antenna, or both - anything to reduce the signal strength coming in.

1315. FBB 5.15c & KPC 3

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-28 00:44:10 UTC
From: phil@perth.DIALix.oz.au
Message-ID: <3l7m4qpuk1@perth.DIALix.oz.au>
Source record: 44286

Greetings,

I've been helping a new SysOp here in VK6 get started with FBB v5.15c, however, I'm not of much help due to the TNC he is using. The TNC in question is a KPC 3 of which I have no knowledge. I have been using FBB since v5.13 & the TNC's I have been using is a PK-88 & a locally produced TNC2 clone which both use WA8DED EPROMS's. From my experience, these provide the most stable setup.

Apparently the KPC has a HostMode which from what I can gather, is a hybrid much in the same way the AEA HostMode which is built into the PK88 & the PK-232. The main problem lies in the processing of TPK broadcasts. The TNC will produce a TPK broadcast (message sent unproto), but will not respond to any sync requests from TPK stations. This is the same with the AEA HostMode & the only way around it I found was to install 100% DED compatible EPROM's. The EPROM images were supplied in the 5.15 archive.

The solutions I see based on my experiences are:

1. Obtain an EPROM image with DED code on it.
2. Run the G8BPW switch.

I have run BPQ with FBB before, but prefer not to sure to the amount of memory that BPQ consumes. If BPQ is the only option for the KPC TNC, can anyone direct me to an FTP site where I can get the latest version from? BTW, does anyone know what the latest version of BPQ is?

Tnx in advance.

1320. Setting time zone in TPK 1.82

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-28 04:32:51 UTC
From: mconner@rain.atms.purdue.edu
Message-ID: <3l83hj$bf@mozo.cc.purdue.edu>
Source record: 44193

I would like to keep my computer clock on local time, but have TPK use
UTC. According to the TPK manual, there is a way to do it using the
line 'TZ=FRA+5', for example. However, I don't seem to be able to
find the right place to put this line. I've tried the DOS
environment, from within TPK, and near the end of the CONFIG.TPK file.
Anybody know how to do it?

Give a try to ftp.funet.fi,somewhere in the ham radio file section,there
is a mac section
Also oak.oakland.edu has a macintosh ham radio section.

Last, but not least,there's Gallery's BBS at 202-333-0407,wich specializes
in Mac Ham shareware.

1325. KISS buggy in MFJ1270B?? Help

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-28 14:39:51 UTC
From: rumbalj@govonca.gov.on.ca
Message-ID: <1995Mar28.143951.18358@govonca.gov.on.ca>
Source record: 44222

Hello and thanks for reading this.

I am wondering if anyone knows what versions of MFJ's 1270B firmware (if any!) have know bugs in the KISS implementation?

We are having problems with such a tnc used in KISS mode running under JNOS 1.10i. It was suggested that our problems "might" be because of a bug or bugs in the KISS implementation of that PROM.

On a slightly different note, does anyone know of an FTP site from which I can obtain a recent version of a KISS-only ROM image for burning my own eproms?

Your help is appreciated. Thank you in advance.

Keith Sproul is the Chair of the TAPR APRS SIG (Special Interest Group).
I believe he is also posting the latest version of the software on
ftp.tapr.org

The APRS SIG mail group is very active discussiong both Mac and PC
verions, since both software authors are on-line.

Plus all of the past discussions are available in the archives.

Hope that helps.

Cheers - Greg, WD5IVD

TAPR can be reached via the Internet. The Automated Information Server that
TAPR provides allows anyone to request information on TAPR, products,
newsletters, and lots of other files. To find out more about this service,
send an e-mail message to listserv@tapr.org with the subject line "Request"
and the following text in the body of the message:

help (for a brief set of instructions)
index -all (for a list of all file by topic area)
list (for a list of TAPR Mail Groups)
get tapr taprinfo.txt (or info on TAPR)

In the above message example, "help" retrieves a brief set of instructions
for info, "index -all" retrieves a list of available files by topic and
"taprinfo.txt" retrieves a text file containing information on TAPR and what
TAPR is all about. If you want to retrieve several text files with one
message, use a separate line for each "get filename" request.

Special Interest Groups

TAPR maintains several SIGs in various areas. To get the latest list of
SIG groups, send an e-mail message to listserv@tapr.org with the subject
line "Request" and the following text in the body of the message:

list (for list of mail groups on TAPR.ORG)

To request the information on any mail group, send an e-mail message to
listserv@tapr.org and in the message text include:

information listname (where listname is the name of the mail group)

When you are ready to subscribe, send e-mail to listserv@tapr.org with the
following command in the message text:

subscribe <list> <your name>

List should be the name of the mail list you want to join and Your Name
should be both your First and Last Name.

Current SIGs include:
NETSIG Regional Networking SIG
BBSSIG BBS SIG
HFSIG SIG on HF Digital Topics

Dave,
It's partially dependent on your radio and the others on the frequency.
For starters, try and set MAXframe to at least 4 and
if your frequency does not have hidden transmitters consider setting
MAXframe to 7. You also want to set parm's #13 and #14 to about
two or three times MAXframe.

If you look at the thruput vs. TXD and MAXframe values at 9600 bps
you will want to stay away from low MAXframe values. At 1200 baud,
it doesn't impact thruput as much.

I am supposed to do a paper on packet radio for a computer course. problem is that I have been having trouble getting info. So far most of my info comes from the WWW packet radio home page. If anyone can suggest other sources, be they on the internet, magazine articles or books that, while not dealing specifically with packet radio, contain sections on it I would be most grateful.
If you could either post suggestions here or email me at:
wrmyk@mailserv.mta.ca

Thanks in advance,
Ramsay Mayka

1334. 9k6 modem waveforms

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-28 21:02:48 UTC
From: dme@ingersoll.COM
Message-ID: <9503282302.AA06725@ingersoll.com>
Source record: 44208

In my quest to improve the BER of the new 9600 baud link we are putting up here, I discovered something that doesn't look quite right.
There are two modems involved, one TAPR modem, and one MFJ-9600 modem.

The xmit eye pattern being generated by the TAPR (new style) modem looks beautiful, and is received 100% by the MFJ-9600 (G3RUH clone). However, the xmit eye pattern being generated by the MFJ-9600 looks quite crummy compared to the TAPR, and not all of the packets are received by the TAPR modem. Now, I am monitoring the eye with a scope right at each modem's output, not after the receiving IF, so the dirty pattern is at the output of the modem. None of the other alternate waveform settings improve things either.

Anyone else have this experience with the MFJ-9600 modem? How clean should the xmit eye pattern actually look?

The MFJ has had the XMIT switching mod done from the factory which allows tx audio to be on 100% of the time. Any other mods floating around?

The problem is that you're trying too hard - CompuServe internet addresses
are much more simple than what you tried:

73470.262@CompuServe.Com

Try that and you'll be pleasantly surpirsed to see that it works, I'll betcha.

Dat lijkt me uiterst onhandig.

>Het draait nu in de 2G4Hz liscence-free band met 100mW .Het gebruikt
>SreadSpectrum DQPSK (Direct Q? Phase Shift Keying) en CSMA/CA . Een beetje
>duur Hfl 1800,-

Differential Quarternary Phase Shift Keying
Probleem 1. met WaveLAN: Het is de vrije industriele frequentie.
Probleem 2: Ook sommige magnetrons werken in deze band.
Probleem 3: 100 mW zendvermogen is voldoende voor enkele tientallen meters.

Het WaveLAN is dus exact toegesneden op het doel Local Area Network.
Je hebt meerdere Watts nodig om een kilometer ver te komen. En dan nog alleen
met een gerichte (parabool of hoornantenne).
De antenne + hoogvermogenmodulator maakt het zaakje snel te duur.

Groeten,

Hendrik Rood

From: andrewb@europe.ebay.sun.com
Message-ID: <3lcgr6$7ds@male.EBay.Sun.COM>
Source record: 44234

Hello,

Since I am not a HAM, I would like to find out if packet is allowed on 27mhz C.B. band for non-commercial (personal) applications. I would like to access my computer within a 5 Miles area. 5Watts on 27 Mhz might be just right... Wireless freqs for micro-cellular data (around 900Mhz) don't have my required range.

Is it legal to do that ?

Thank you,
Andrei

1352. CQ Magazine Highlights - May, 1995

HIGHLIGHTS OF MAY, 1995 "CQ" MAGAZINE

Copyright 1995 by CQ
Communications, Inc.

Results of the 1994 CQ World-Wide WPX CW Contest highlight the May, 1995, issue of "CQ", along with a fascinating report on the 9G5TL DXpedition to Ghana for the 1994 CQ World-Wide DX Contest.

Operating a DXpedition station during a major contest is the dream of many an avid DXer and contester. But imagine doing it from a country that, just two years earlier, had considered it a crime to operate a ham radio station. "The 9G5TL Story," by Warren Hill, KF7AY, tells the exciting tale of planning and preparing for this ham radio adventure, the thrills of operating from a rare country during the biggest contest of them all, and of the long-term benefits of the operation to ham radio in Ghana.

The 1995 CQ WW WPX Contest is now history (for the uninitiated, that's short for the CQ World-Wide Worked All Prefixes Contest, in which you try to contact as many stations with as many different callsign prefixes as you can during a 48-hour period). And the results are in from the 1994 event. May's "CQ" magazine reports fully on the CW portion of the contest. Here's a brief list of the trophy winners:

Single Operator, All Band --
-- World: John Crovelli (W2GD), P40W
-- USA: Tyler Stewart, KF3P
-- Oceania: Michael Sato, AH6MZ
-- Canada: John Sluymer, XL3EJ
-- Canada, low power: Gary Caldwell, XL7NTT
-- Japan: Satoshi Hara, JH5FXP

Single Operator, Single Band --
-- World: Martin Monsalvo AZ4F (LW9EUJ)
-- World, 7 MHz: Bob Furzer, 9K2ZZ
-- World, 3.5 MHz: Pavel Vachal, OK1DXS
-- Oceania: Boyet Lorenzo, 4F3AAL
-- USA: John Yodis, K2VV

-- USA, 28 MHz: Phil Koch, K3UA
-- USA, 21 MHz: Scott Jones, WR3G

Multi-operator, Single Transmitter --
-- World: Station ZX0F (PY0FF & YU1RL, operators)
-- USA: Station WC4E (WC4E, K1ZX, G4BKI/W4,

I used to run a packet mailbox on an old Amstrad PC512 (8086). You
shouldn't have any problems providing it uses some flavour of MS-DOS.

1355. CompuServe refuses email from ampr.org addresses?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-29 00:00:00 UTC
From: chris@kd3bj.ampr.org
Message-ID: <D66ME4.7JG@kd3bj.ampr.org>
Source record: 44238
Cross-posted to: rec.radio.amateur.digital.misc,comp.mail.misc,comp.mail.smail,comp.mail.elm,comp.mail.headers

I can receive mail from CompuServe, but I can't send mail. Is there some known problem with discrimination against ampr.org addresses? When I send a message I get errors like:

? EMQLIB - Unable to verify organization
? Invalid receiver address: 73470.262@ARL-GW-1.COMPUSERVE.COM
? No valid CompuServe receivers found in envelope

Is ARL-GW-1 and Amateur Radio gateway that's bouncing me? If it is, it has no damn business doing it.

My system (Unix SVr4.0, smail, elm) is both on the Internet and the Amprnet. The mail I'm having problem with is being sent over the Internet. I can RECEIVE email from CompuServe but when I send mail to CI$ addresses it comes back with a form letter from "postmaster@compuserve.com" telling me, among other things, that the comma becomes a dot. I KNOW the comma becomes a dot! When I write to "postmaster@compuserve.com" I get the same form letter. Pretty useful postmaster, eh? When I try their 800 number it's always busy. Arghh!!

I know several people on CI$. I've tried them all with no luck. They can send to me, but I can't send to them.

Of course, I can send and receive email to every other major service --- AOL, Prodigy, etc... and to other, more lowly Internet addresses. CI$ wants something special.

Can anyone hazard a guess what.

Here's the "helpful" reply I get:

Re: Undeliverable Message

Your message could not be delivered as addressed.

--- Returned message ---

Subject: Addressing CompuServe Mail users

A message you sent to a CompuServe Mail user could not be delivered
due to an incorrect address. The correct method of addressing
CompuServe Mail users is outlined below.

Five types of CompuServe Mail addresses can be reached from the
Internet as follows:

a) Members of the CompuServe Information Service have an address
(a.k.a. User ID) of the form "xxxxx,yyyy", such as "74906,1610".
To send mail to such an address from the Internet, change the
comma to a period and attach "@CompuServe.com". For instance:

74906.1610@CompuServe.com

[stuff deleted]

Finally, please realize that only CompuServe Mail users have access
to our member directory. Since there is no mechanism for you to
obtain addresses directly from CompuServe Incorporated, you should
obtain this information from the individuals with whom you wish to
correspond. Thank you.

Cordially,

The Electronic Postmaster

1359. Wireless transmission of serial information?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-29 00:10:43 UTC
From: goliath@tiac.net
Message-ID: <3la8ld$4oi@sundog.tiac.net>
Source record: 44145

I am interested in sending the information coming through a serial cable via airwaves a couple of miles
to a PC. I don't really know anything about digital radio transmission, so I was wondering if anyone
could tell me:

1) What frequencies are generally used for this kind of transmission
2) What the cost is for a transmitter & receiver that would do this
3) Where I can look to investigate this matter further
4) If there are any packages already made that do this
5) If this is even reasonable to expect to be able to do

Thanks in advance,
Stefan

[edited]

In case you have to do this with a Macintosh, here's how I did it:

The secret is an Apple desk accessory called KeyFinder.

The instruction book that Kantronics supplied with the TNC didn't
tell you what you were trying to do, and of course, it was nonsense
to do the PC process on a Mac.

To do it on a Mac, launch KeyFinder, then activate the "Programmer Mode",
which will show you the Decimal/Hex/Octal equivalent of any character
you select. Then experiment til you find the characters with a DECIMAL
VALUE of 192 and 255. (They are Hex C0 and FF).

Then type the three key sequence 192-255-192 by clicking those characters.
That will put the sequence you want in the KeyFinder window in the
right-hand side of box. Now use a COPY and PASTE operation to send
this sequence to your TNC software (I'm still using a regular old
terminal emulator).

The method to get away from the "HOST" mode is similar, except the
sequence is DECIMAL 192-113-192, the middle character being a "q".
That's Hex C0-71-C0...

Hope this doesn't come out too confusing. I see that I didn't explain
above that you must select these characters using the mouse to click
on them, since some of them can't be typed on the keyboard. It's really
pretty simple.

Hope this fills a need for someone out there. I sure could have used it.

73's all, -John

>Probleem 1. met WaveLAN: Het is de vrije industriele frequentie.
>Probleem 2: Ook sommige magnetrons werken in deze band.

Zendamateurs kunnen het wat lager instellen (2350MHz of zo) en dan heb
je geen last meer van magnetrons, die op 2450MHz zitten. Overigens valt
de storing van magnetrons wel mee. Ze stralen niet erg, zijn redelijk
stabiel, en worden vaak maar kort gebruikt.

>Probleem 3: 100 mW zendvermogen is voldoende voor enkele tientallen meters.

>Het WaveLAN is dus exact toegesneden op het doel Local Area Network.
>Je hebt meerdere Watts nodig om een kilometer ver te komen. En dan nog alleen
>met een gerichte (parabool of hoornantenne).
>De antenne + hoogvermogenmodulator maakt het zaakje snel te duur.

Op die frekwentie kun je nog net met yagi's of helixen werken, hoewel
een parabool beter is.
Dat het zo slecht gaat komt vooral door de slechte antennes en ongunstige
omgeving. Als je gerichte antennes op het dak zet gaat het veel beter.

Ik kan je geen getallen geven voor Wavelan omdat ik de parameters niet
ken (bandbreedte en benodigde signaal/ruis verhouding), maar "meerdere watts
voor een kilometer" lijkt me toch sterk.

1366. TTL Con. for MFJ 1278

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-03-30 00:00:00 UTC
From: gerheim@PROBLEM_WITH_INEWS_GATEWAY_FILE
Message-ID: <3le7kr$epu@hatch.sonalysts.com>
Source record: 44153

I'm looking for a TTL connector for the back of an MFJ-1278. The
TTL FSK output is piggy-backed onto that connector, and I need
it for RTTY (the right way). I'm using 2 battery connectors the
nice man at radio shack _gave_me_. I have to be careful to
line them up on the right pins when I connect them.

[The "right" way is to _not_ use the internal transmit modem and
not use the SSB mode on your XCVR. You get a nicer RX filter
with the XCVR on RTTY.]

Any leads or offers?

One thing to remember is that, according to the manual, the numbers must
be from the sidebar number pad and not the ones above the qwerty. So, it
may not work on some smaller keyboards.

: Can I upgrade my station to 9600 w/o a large equipment purchase?
: If I can, what's involved?

Unfortunately, no. The FT-530, being a handheld, would be difficult, if not impossible, to modify for 9600 baud. Even if you could, the KPC-3 won't run 9600 baud. The amp would have to be a very fast switching amp in order to acheive the rise/fall times that 9600 needs to work efficiently.

Hello Richard,

I have an old '88 laptop (Dual floppies, no Hard drive) that I have been
using just fine running Baycom software and homebrew "baycom" modem.
Several hams in the area use the older '88 cpu's using the BayPac modem
from Tigertronics. We all love our baycoms! Plus they only cost about $50 :)

Hope this helps.

> Since I am not a HAM, I would like to find out if packet is allowed on 27mhz C.B. band

No it isn't but with the no code license available by a book read a week and get your ham licensne. It will open up lots of doors.

Source record: 44165

ARE YOU SEEKING A CAREER OPPORTUNITY IN RF ENGINEERING?
Your interests in amateur radio maybe relevent to an exciting career.

If you have 2 to 5 years or more experience in RF Engineering and a passion for Wireless Data Communications, then McCaw Cellular Communications would like to talk to you. The Wireless Data Division of McCaw currently has several RF Engineering employment opportunities in the Seattle Area at our headquarters. These opportunities are in CDPD Systems Performance Engineering and RF Test Engineering.

As the champion of Cellular Digital Packet Data (CDPD) technology, McCaw is the recognized innovator in wireless communications. Our new alliance with AT&T brings an even greater opportunity for technical challenge and achievement. We're seeking highly motivated individuals to work in our open, supportive and dynamic enviornment.

Qualifications should include experience with RF systems design or cellular system engineering. Your background in any of the following will be helpful: UHF analog and digital radio systems and telephony; RF test and measurement; Packet switching and router-based networking; MS-DOS/Windows or Unix operating systems; experience with Ericsson and/or AT&T cellular equipment desireable; MSEE or BSEE required.

To apply, please send your resume and cover letter to katherine.deforest@airdata.com or mail it to People Development, McCaw Cellular Communications, 10230 NE Points Drive, Kirkland, WA 98033. Attention: Katherine DeForest. No phone calls please.

It probably has the KISS reset which goes to the default parameters if
there is no activity for a period of time. This will do things like take you
out of full duplex if you are operating on the satellites (ugh!), plus assume
the default values for other parameters, like persist, txdelay, etc.

>? No valid CompuServe receivers found in envelope

>Is ARL-GW-1 and Amateur Radio gateway that's bouncing me? If it is, it
>has no damn business doing it.

No it isn't.

It's the CNAME of "compuserve.com", a machine which refuses to handle
"#####.#####@compuserve.com" mail. Impolite, eh?

I figured it all out with nslookup.

The host that DNS returns as "compuserve.com" refuses to handle CI$ mail
and will not reroute it to the MX host "mailgate.compuserve.com".
Assuming this setup is intended, they obviously want compuserve.com mail
to go to mailgate.compuserve.com, a different host, and they don't want
ANY leakage load on the host really named "compuserve.com", so they
refuse to route through there. Instead, they send out a confusing,
impolite error message.

Seems impolite, but, hey, it's their system, they can do what they want
with their DNS records.

My smail configuration was set up to mail directly to the hostname in
preference to its MX --- wrong! This obviously dosen't work for CI$.
I fixed my configuration and have seen no bounced mail. (Whether it
arrives there is another story.)

Strangely, I can send mail to other inet hosts that aren't their own MX
forwarders, including some of the other major services, so somehow
1+1=1.99 in my reasoning. But when I simply changed the order of the
entries in my "routers" file for smail, none of my mail to CI$ has
bounced.

Maybe CI$ uses Pentiums for mail routing. I had heard they use NT machines.

The only thing that I can see wrong is the ARL-GW-1 on there. Is it
safe to assume you sent to xxxxx.yyy@compuserve.com and that's what
got bounced?

Even if their systems is rejecting ampr.org mail, for whatever reason
they might have, it should work 'bouncing' in thru a differnt system.

>14.097, 14.103, etc., for packet) whre they cluster?

Most GTOR ops occur in the "AMTOR/PACTOR" portions of the HF bands.

Check out the following freq ranges...

3630 to 3640
7070 to 7080
10130 to about 10140
14070 to 14083 (they push a little into the RTTY area)
21070 to 21080??

These are the areas where I have found GTOR operations.

Also note that the warning at the end of the announcement
expressing concern over a bug report in the CTEXT or
BTEXT messages looks like it was a hardware problem in
the TNC being used and not a software bug. Sorry for
any confusion - but I received the warning after
uploading it to internet and just prior to the
announcement, limiting my options rather. Any change
to this (like it wasn't a hardware funny) and I'll
post the fact.

And it is a great program also.
tnx for building
the update

Euh, dat lijkt me niet, daar zit ATV, 2380 is o.a. voor digitale transmissie.

>>Probleem 3: 100 mW zendvermogen is voldoende voor enkele tientallen meters.

>>Het WaveLAN is dus exact toegesneden op het doel Local Area Network.
>>Je hebt meerdere Watts nodig om een kilometer ver te komen. En dan nog alleen
>>met een gerichte (parabool of hoornantenne).
>>De antenne + hoogvermogenmodulator maakt het zaakje snel te duur.

>Op die frekwentie kun je nog net met yagi's of helixen werken, hoewel
>een parabool beter is.
>Dat het zo slecht gaat komt vooral door de slechte antennes en ongunstige
>omgeving. Als je gerichte antennes op het dak zet gaat het veel beter.

>Ik kan je geen getallen geven voor Wavelan omdat ik de parameters niet
>ken (bandbreedte en benodigde signaal/ruis verhouding), maar "meerdere watts
>voor een kilometer" lijkt me toch sterk.

In het ARRL handbook staat een artikel over een 2 mB link die amerikanen
hebben gebouwd en ze konden zelfs 10 mB gebruiken over een afstand van
40 km. Output: enkele milliwatts, namelijk deuropeners (ze gebruikten wel
schoteltjes uiteraard).

Even iets anders... als 'men' op ISM frequenties (ook wel de vuilnisbak
van de ether genoemd) werkt mag men geen rechten ontlenen aan deze praktijken.
Wees bedacht op het feit dat de boel niet altijd 100% kan werken. M.a.w.
als iemand (die zendamateur is uiteraard) een antenne aansluit op de golfpijp
aansluiting van z'n magnetron (heb je toch 500 watt output op 13 voor weinig)
kan het wel eens zijn dat je o zo dure LAN link niet meer o zo goed werkt :-))

The Netherlands, March 31, 1995.
Hello dear reader,

Today I distributed NET_Mac2.3.50.sea.hqx...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac I implemented the following:

- ON1XK added a Timer-Task instead of the 'realtime stuff'
(for more details check the online HELP-info for the 'realtime' command)
- Added support for the AmSoft 'World Of Ham Radio CD-ROM' callsign database
(for more details check the online HELP-info for the 'callbk' command)

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim archives.

The new NET/Mac has (hopefully) been uploaded to:
ftp.ucsd.edu, to the directory hamradio/packet/tcpip/incoming.
If it's not there then look at hamradio/packet/tcpip/mac.

Scott WY1Z may have also uploaded the new version to:
oak.oakland.edu, to the directory pub/hamradio/mac/digital.

NET/Mac will be uploaded to PI8HVH.AMPR.ORG, directory public/mac.

Adam PA2AGA (e-mail: adam@iag.tno.nl)
(or: pa2aga@iag.tno.nl for letters only, NO BIG files here)

P.S.

The implementation of the timer-task may introduce incompatibility with old
Mac-OS System versions. NET/Mac 2.3.50 successfully runs on a Mac Plus, IIx,
SE/30, PowerBook 100, and Power Macintosh 6100/60. Ivo and myself used System
versions 6.0.7, 7.1 and 7.5.1 and we had no problems at all.

If you have problems running NET/Mac 2.3.50 then please let me know about
the problem you encounter and the kind of environment you are using
(System version, Mac type etc..), so that I can investigate the problem.
I will have a NET/Mac 2.3.50, without the timer task, but WITH the old
'realtime' procedures available for you then...

: Is it legal to do that ?

I don't think it is legal. See part 95 in Title 47 CFR. To the best of
my memory, I think it says something like:

Permitted emissions include voice...and tones necessary to establish
or continue communication.

I think the intent is a selective calling system, not digital info.

From: seafair@rhf.bradley.edu
Message-ID: <3lh9g1$fei@rhf.bradley.edu>
Source record: 44184

The pinouts on my 8200 are the same as a DB25 connector as far as 2,3,7 are concerned. Looking INTO the connector on the 8200, pin 1 is the right hand end pin. Dunno about pin 20 or the others but you can get data in and out of pins 2,3. 7 is ground.

Try ftp.oakland.edu.pub/hamradio/pc/hamutils
Then there's ftp.tapr.org

The latter has all the versions for both the Mac and Pc.

Hope this helps, if you need more let me know. 73

Something in the original KISS code causes it to inexplicably crash.

You might try sending a 'param ax0 253' to turn off the workaround code
put in to help avoid the crash. The workaround has side effects if
you're not on a busy channel (W6SWE described them well)

[]
Well, I did hear of a BB that ran on an old BBC machine! However, if you want to get started without much setting-up of software, then (provided your machine has a serial port), I'd get a TNC to go with it, rather than trying to run any of the prog.s that implement the packet protocol inside the computer; in short, just use the computer as a terminal to the TNC (with disc storage as an added bonus over a normal terminal). This is an excellent use for older computers; I use a BBC Master for packet myself, though this is a bit overpowerful IMO.

It is a lot easier to use if the terminal software you use provides a split screen, i. e. what you are typing in one half of the screen (usually the bottom)
and what is incoming in the other (often a split other than fifty-fifty), but if it doesn't, turn echo off on your TNC, and it is still usable.

1410. Recruiting Elmers from the Internet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-01 00:00:00 UTC
From: pschleck@gonix.com
Message-ID: <pschleck.796747779@gonix.com>
Source record: 44093
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.policy,rec.radio.amateur.space

As readers of the rec.radio.amateur.* newsgroups are probably aware, I maintain a periodic information posting known as the Amateur Radio Elmers Resource Directory (aka the "Elmers List") which provides a list of net Elmers, indexed by topic, and their E-mail addresses. (For users of threaded newsreaders, this article is linked to the base article of the Directory itself).

As noted elsewhere, the Amateur Radio Elmers Resource Directory is 4 years old as of last month. In order to maintain its value to the net, I have strived to keep it accurate and up-to-date. In addition to reviewing the currency of the entire list every 2 years, I am constantly scouring the newsgroups for new Elmers to join the list.

There's always been an implicit invitation for any qualified person to join the list. However, since I've lost about 1/3 of the list due to attrition from my last biannual mass-ack (i.e., no response at their last-known E-mail addresses), felt the need to send out this explicit invitation. I'd like to replace the lost Elmers with new, motivated, quality Elmers from the net. Areas of expertise that are most desirable for the list right now include:

- Military Affiliate Radio System (MARS), particularly Army and Navy/Marine-Corps. MARS (as I currently don't have any MARS Elmers from those branches)
- Advanced homebrewing techniques (surface-mount, VLSI, DSP, spread-spectrum, etc.)
- TCP/IP Packet Radio and Gateways/Internetworking (particularly local IP coordinators and/or subnet managers/operators/leaders)
- Amateur Satellites/Space Operation (particularly Microsats and SAREX)
- Amateur-related Software for Unix/PC/Mac/Amiga/Psion/HP-95
- College Clubs and organizational guidance/strategies
- Boy Scout Amateur Radio Merit Badge Counselors
- Unix/Linux/X-Windows programming and configuration
- Amateur Radio Organizational Contacts (I am especially looking for contacts for the ARRL Field Organization, GRAPES, AMSAT, QCWA, QRP Int., NARA(?), QRZ, CSVHFS, LAMBDA, ARES, RACES, FEMA, any state OES or EMA, as well as any regional frequency coordinating body)
- Band, Mode or, Brand-specific equipment (actual manufacturer or dealer contacts would be quite welcome, as long as they reveal their affiliation and at least provide *some* free services)
- Maintainers of unique amateur-radio-related anonymous File Transfer Protocol (FTP) sites and World-Wide Web (WWW) Home Pages (as opposed to those that are substantially a rehash of, or pointers to,

existing sites).
- Maintainers of unique amateur-radio-related mailing lists
- Editors/contacts for amateur-radio-related publications

Although expertise in any other area would, of course, be welcome also.

I'd like to emphasize that participation is totally voluntary, with very minimal obligations (1 or 2 polite inquiries a month, if feedback from existing Elmers is any indication). If you find that it is too much work, you are welcome to bow out, no questions asked. In the 4 years I have managed the list, only a handful of Elmers explicitly resigned, and usually only because of severe professional or personal obligations, or their interests or expertise changed. You don't even need access to netnews, just a reliable E-mail address.

I've also attempted to seek out people on the net who I think would be good Elmers. If you've received a personal E-mail invitation from me, I urge you to give it serious consideration. The net would appreciate your volunteerism.

If you'd like to volunteer, or just discuss further what volunteering would involve or if your contribution would be desirable and fit within the Elmers List's mission and editorial policies, send me some E-mail to the Elmers list administrivia mailbox below (the default Reply-To: of this message; an autoreply daemon will respond with an acknowledgement message and I'll be in touch with you personally very soon).

>de Curtis

Well that's your problem, Curtis, you looked in Part 97. CB is a
Part 95 service. In the US, only voice is permitted for Part 95
operations, data transmissions are not allowed *except* for limited
remote control applications, which are permitted under somewhat more
restrictive rules. No RTTY, AMTOR, etc. Now this is *not* the case
in other countries. Some of them *do* permit data transmissions on
their CB band. So we have to be careful when saying data is not
allowed on CB, because it is in some countries, but not the US.

NAVTEX operates on 518 KHz and transmits data via FEC Broadcast mode
amtor/sitor mode "B" (broadcast mode)...
...
There are symbols used in the header information that is broadcast that
describes the type of message it is, i.e. > Weather Alert ; Navigational
aid - notice to marinars(sic) etc..
...
you set up commands in your recieve equipment to define what type of
NAVTEX
messages you are interested in receiving. Each outbound NAVTEX message
also has a mesage number. Your receive equipment would not print the same
message twice if the message was received twice..
...
Additional details can be found in any of the current Kantronics Manuals
for their
KAM "Kantronics-All-Mode" Terminal Node Controller. Software versions
starting at Ver 3.0 support receive of NAVTEX..
...
you might try contacting Kantronics for information on NAVTEX commands
and/or
read over a manual that an amateur may have for the KAM with Ver 3.0 or
above of their software..

What? Little white sheet? Part 97? We're talking the Citizens
Radio Service, which is authorized in Part 95, not Part 97.

micah (micah@community.net) wrote:
: I own a Baycom TNC that tiger tronics sells, if I remember right it cost me
: $50.00 I currently use it, and I have allmost all of the bugs worked out. I
: give it my whole hartfelt endorsement. I will admit that I did have some
: problems with it at first but I received excelent help from the support person
: at tigertronics. This is my first TNC.

: It took me a few tries to get my connector wired right to my Radio (I use a
: HTX-202) and I found that the operating system that came with the tnc for my
: computer had a couple of small bugs in it, (some of the commands were programed
: wrong, the good by text was the welcome text and visa, versa. But easly worked
: around).

: I found that the Baycom TNC to be a pretty nice TNC for what it is. (a no
: frills TNC) I thnk that it is best to use the software that comes with it.

: If you do decide to purchess the TNC and have a few questions. Feel free to ask
: them.
I just received my Baycom TNC and I'm having a couple of problems that go
like this:
So far I've been able to wire my FT-23R to the unit but I can't get
things working. I tried the Baypac calibration program and according to
that, things are fine. It will transmit high and low tones and the audio
receive registers OK when I open the squlech. When I run the TNC program
however, it remains QRV during receive even with the squelch open. While
monitoring with another radio, I can try to connect to a station but it
sounds like short burst of feedback on the monitor. To really confuse the
situation, if I try to connect to MYSELF, I get a normal sounding packet
on the monitor, and I make the connection!! What is going on here?? One
mor interesting twist is that I can connect to myself with no radio
connected. Sounds like a loopback test but why and how?

I would appreciate any input on this before I have to call Tigertronics.
Thanks

Hi,

Has anybody out there had any success with running AX.25 in Linux? I've tried patching the kernel with the files from sunacm.swan.ac.uk, but when I do the make, it always ends with a bunch of errors related to the ax.25 sources.

I'd really appreciate any help on this!

Thanks,
Chris

HB9CVV has posted (via myself) a very good OS/2 packet program that works with the PK232 and PK900 by AEA. It is called THS and is available on Compuserve in the hamnet packet library.

It works quite well on packet, as well as all HF digital modes except GTOR.

1424. FBB, BPQ and ARES Question

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-03 00:00:00 UTC
From: rkuns@one.net
Message-ID: <3lnf76$un7@mail.one.net>
Source record: 44107

I'm trying to run ARES software for the local Red Cross club on my BBS PC. It is running FBB and BPQ software already. There seems to be some problems with interactions between ARES and FBB. Examples, connects to ARES sometimes connect to the BBS, BPQ sometimes says there are no more ports when there really are, some input to ARES get lost, ...

FBB is configured to use com9 to talk to BPQ. ARES uses DEDHOST configured to use stream 1-9 to talk.

Any ideas on how to configure so both can run?

1425. Need Help: PK232MBX to Kenwood TM-251A Cable

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-03 00:00:00 UTC
From: "Andy R. Barrow" <abarrow@ccnet.com>
Message-ID: <3lo0am$41l@ccnet.ccnet.com>
Source record: 44108

I can't seem to get my connection between my PK232 and the packet connection on the back of my Kenwood TM-251A. It works with my KPC-3, but with my PK232, all I get is the tuning indicator going sort of half-on, and nothing else.

Anyone assembled a cable for this arrangement? I'm wondering if I need a capacitor or something.

Thanks!

If you are looking for a TAPR1 or TAPR2 TNC program or one that will also work in OS/2 3.0 Warp with the AEA 232, PK88, PCB88 (with a little cheating to not let it init on startup) or the AEA PK900,

YES!

Get a copy of XHS611.ZIP which is HB9CVV's OS/2 specific TNC program for these items. It WORKS. The only thing about it with the PCB88, aside from one command that you can't disable and forces you to always start the program without re-initing the TNC, is that it doesn't have the mailbox feature built in to it for the AEA 88 series, or I guess the PK232. If you don't init the TNC on startup, and the MB is set to on in host mode, it will stay on for you during a PHS session.

I fought over this port polling mess in OS/2 DOS VDM sessions for MONTHS until I got this one, which is freeware.

Thank Peter, HB9CVV, he has done a FINE job with the code.

Also, BPQ408A is out, which has the OS/2 drivers in Beta Test. If you are about running a PBBS, and have other code that will run in the OS/2 arena with BPQ, that might work. I'm playing with that now.

If you need either of these items and can get to FIDONET, I can get them to a Fido board for FREQ, probably 1:117/130, but not on the Inet.

>
>Greetings Rob (PE1PQJ)
>
>QTH JO32BL
>
Look for XHS611.ZIP written by HB9CVV, Peter. It has both THS and PHS
in it for OS/2. THS is for TAPR1 and TAPR2 TNC's. PHS is for the AEA
PK232, PK88, PK900 and, with a little trick, will work with the PCB-88
internal buss type TNC.

Only the versions in XHS611 would work for me with OS2 2.11 full pack or
3.0 Warp. The earlier versions were flawed, but this erelease works fine.
The only lacking feeature for the AEA modems is the lack of support for the
AEA mailbox PBBS features built in to the AEA TNC's. The trick with the
PCB-88 is to set it up under AEA's PakRatt program or PPWIN. Then,
when you start it up under OS/2 with PHS, do not let PHS init the TNC on
entry to the program. If you do you will be enable to properly reset the add
<CR> to end of lines and it won't let you reset the parameter in KISS mode
either.

PHS doesn't seem to support the AEA mailbox features either, at least not
with my PCB-88 internal buss card TNC. However, if you leave the PCB-88
in host mode on exit from the setup program, it is enabled all along during
the time you are in OS/2 use with PHS.

If you cannot find this package and can get to a Fidonet node, I can get it
set up for you to FREQ at 1:117/130, I believe.

AUSTRALIAN NATIONAL AMATEUR RADIO TELEPRINTER SOCIETY

For information of all potential contestants and the Editors
of all appropriate publications. These rules may be
published at the discretion of all readers.

A.N.A.R.T.S. To be held on the week-end of
10th-11th JUNE. 1995.
WW RTTY CONTEST
Australian National Amateur
Radio Teleprinter Society.
RULES P.O. Box 860, CROWS NEST, NSW 2065.
==========

These Rules are distributed to cover the 1995 ANARTS WW RTTY CONTEST.

TEST PERIOD: Contest takes place on the second full week-end of June in
each year. Contests start 0000 UTC Saturday and end 0000 UTC Monday.
The 1995 contest is to be held 10-11th June.

Not more than 30 hours of operating is permitted for Single Op. Stations
Non operating periods can be taken at any time during the contest.

Multi Op. Stations may operate the entire contest period.

Summary of operating times must be submitted with each contest log.

BANDS: Use Amateur bands 80, 40, 20, 15 and 10 metres.

MODES: All digital modes permitted (RTTY,AMTOR,FEC,PKT,PACTOR)
NOTE: No satellite operation permitted.

CLASSIFICATIONS: (A) SINGLE OPERATOR (One transmitter)

(B) MULTI-OPERATOR (One transmitter)

(C) SWLs

MESSAGES: To consist of RST, TIME (UTC), and (CQ) ZONE.

SCORING: For each band used - As per Exchange Points Table to obtain
QSO Points. (This Table was revised 1994 and is so marked).
Count Countries worked (see definition)

Total all bands used to obtain (1) Total QSO Points.
" " " " " " (2) Total Countries.

World stations calculate "VK BONUS" which is 100 points for each VK worked on 14MHz; 200 points for each VK worked on 21MHz; 300 points for each VK worked on 28Mhz; 400 points for each VK worked on 7MHz and 500 points for each VK worked on 3.5MHz.

CLAIMED SCORE for WORLD STATIONS is calculated by multiplying (1) TOTAL QSO POINTS by (2) TOTAL COUNTRIES then THAT TOTAL by (3) the NUMBER OF CONTINENTS WORKED during the contest.(Note that each continent counts once only to a maximum of 6). To the total obtained ADD the "VK BONUS" to show GRAND TOTAL CLAIMED SCORE.

Example for World Station: 720 points from zone chart (1) X 29 countries (2) = 20,890 X 5 continents (3) = 104,400 pts plus(+) 6 VK stations worked on 14MHz (that is 600 points) giving a grand total of 105,000 points.

CLAIMED SCORE for AUSTRALIAN STATIONS (VK1-VK8) is calculated by multipying (1) TOTAL QSO POINTS by (2) TOTAL COUNTRIES and then that total by (3) the NUMBER OF CONTINENTS WORKED during the contest with a maximum of six as stated above. This calculation gives the GRAND TOTAL CLAIMED SCORE.

In all cases, a station may only be worked once per band, but may be worked on other bands for QSO points and multipliers.

COUNTRIES: The country count is as per ARRL DXCC list of countries, except that Australia (Areas 1-8), Canada, Japan, and U.S.A. mainland DO NOT count as separate countries. HOWEVER, each call area VK1-VK8, and each call area in Canada, Japan and mainland U.S.A. DO COUNT AS SEPARATE COUNTRIES.
Contact with ones own country does count for QSO points but does NOT COUNT AS A MULTIPLIER. (NOTE that call areas VK1-8, and in Canada, Japan and USA mainland count as countries).

LOGS: Logs must show in this order:
1. DATE
2. TIME (UTC)
3. CALLSIGN OF STATION WORKED/HEARD
4. MESSAGE INFORMATION SENT/RECEIVED (RST/TIME/ZONE)
5. POINTS CLAIMED.

SUMMARY REPORT: Summary sheet must show: Callsign of station, name and address of operator, bands used (a separate log is required for each band), the points claimed for each band, the number of countries worked on each band, the number of continents worked; and details of VK BONUS calculations for world stations. A summary of the calculations made to obtain the GRAND TOTAL CLAIMED SCORE as per the "Scoring" section will assist checking. The general certification regarding compliance with rules and signature of operator is also required.

Multi-op logs must contain signatures and callsigns of each
operator.

AWARDS: Plaques will be awarded for first place in each Classification.
Certificates will be given to 1st, 2nd, 3rd places in World and also on
a country basis (see above). The judges decisions will be final and no
correspondence will be entered into. Logs become the property of ANARTS

CLOSING DATE: Logs must be received by the Contest Manager, A.N.A.R.T.S
P.O. Box 93, TOONGABBIE, NSW 2146, AUSTRALIA, by 1st September of
the year of the contest.

Note that corrected Exchange Points Tables can be obtained from the Contest
Manager (SASE or similar appreciated) and that the Guide to RTTY Contests
published by N6GG and used by many of the Stateside magazines contains
correct versions of the Table. If in doubt, we can do the scoring for you
but it makes for a lot of work.

Please allow plenty of time for your log to reach the Contest Manager,
last year we had logs, mainly from eastern Europe but also one from South
America which took nearly six months to make the journey, by which time the
results had been determined and published.

73 es Good Luck to All. ANARTS...

The Society will be very appreciative of any circulation of the above
Rules carried out by recipients of this message. Amateurs in any areas
could canvass their local organisations to ensure good coverage.

My mistake about the part 95, but it still said that other operations were allowed, and it was a condensed version of the FCC rules. Check your local Radio Shack for a copy of the little white sheet. I could be wrong, since the CB I used to have was about 3 years old. 73 de Curtis

About a year and a half ago, I talked with somebody from the
Dutch radio detection service, that detects illegal radio transmissions.
He told me that, in Holland, 27MC is kind of a 'wild west'. He even
advised me to take off the microphone of a 27MC transmitter to plug in
my computer.
The moral of the story: In the Netherlands, go ahead with packet radio
on 27MC.

Try PAKET ver 6.1. It is a VERY nice DOS terminal program. It is shareware and is available for ftp from oak.oakland.edu.

Try KAGOLd, it is an excellent prg. I am sure you would like it, I will
try and send you an ascii file on it in private mail Bob,. It is
available from a company called Interflex, out of Laguna Niguel, Ca. I
have been using it for about 3 years. Great prg!!!

Subject: ax.25 with Linux

Hi,

Has anybody out there had any success with running AX.25 in Linux? I've
tried patching the kernel with the files from sunacm.swan.ac.uk, but when
I do the make, it always ends with a bunch of errors related to the ax.25
sources.

I'd really appreciate any help on this!

Thanks,
Chris

Source record: 44130
Cross-posted to: rec.radio.amateur.digital.misc,comp.mail.misc,comp.mail.smail,comp.mail.elm,comp.mail.headers

The DNS you're using probably isn't the one at CI$, it's probably at an
ampr.org node.

Regardless of where the DNS is at, my suggestion of bouncing the mail
through a different system would probably have made use of a different
DNS, and gotten you mail there.

I found this out when I was using a .mil machine that was using a /etc/hosts
file instead of a DNS, and my mail was not connecting to a correct address,
when I routed the mail through a different system, it arrived fine.

Hello

>>After I quit JNOS though and try to use the terminal program again, it just
>>stares at me. Is there a way to "reset" the TNC to non-KISS mode? I
>>currently am having to manually (ie pull the power jumper on the NOVRAM) to
>>reset the TNC.

Before you quit from Jnos try this:

param <interface name> 255

I am running Tcp/Ip on .725. In this way i use:

param 725 255

Try it. It works ok with my MFJ-1278.

The thread was starting to look interesting, even in a language I can't read.

So what is going on in the amateur world of 2.4GHz spread spectrum data transmission? About a year ago someone who works at Phillips gave our local club a presentation on the proposed use of a Phillips chip level product to set up a wireless net. Nobody bit on it at the time, but now with plenty of linux activity how about the possibility of a really high speed net consisting of host nodes about 5 - 10 miles apart?

I recently heard about a Thorne EMI box level product that might also have amateur possibilities.

Comments anyone? Anything happening?

1455. TPK aborting mid-transfer

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-04 00:00:00 UTC
From: phil@perth.DIALix.oz.au
Message-ID: <3lqgiu$9ar$1@perth.DIALix.oz.au>
Source record: 44045

Greetings,

I have had a small recurring problem which is starting to annoy the hell out of me. When sending messages to the BBS, TPK disconnects in the middle of the transfer. It occurs just after TPK has compressed the message to be sent, & TPK disconnects you from the BBS just after it starts sending the compressed message.

Has anyone come across this condition before, & more importantly is there a solution to it. Are there some tell tale signs/conditions to look for?

I posted a bulletin on the VK packet network & the volume of response suggests that this is a widespread problem.

Rgds Phil

1459. How to get started?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-04 00:00:00 UTC
From: Shadowdancer <EEMERI31@MAINE.MAINE.EDU>
Message-ID: <95094.193515EEMERI31@MAINE.MAINE.EDU>
Source record: 44049

Hi there...
I just found out about packet radio a short while ago, and I was
wondering how to get involved?
What kind of equipment do I need? What would an inexpensive rig
cost? What's involved in getting a ham license? In other words, all
the fun and interesting info I'm sure I'd find in this newsgroup's FAQ,
if I knew where to download it from (or some kind soul would mail me a
copy, or perchance post it...)
Thanks for your time!

1460. Kenwood TH78a & Baycom

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-04 00:00:00 UTC
From: jbeaudry@fohnix.metronet.com
Message-ID: <3lt55g$ijj@fohnix.metronet.com>
Source record: 44050

I am having trouble getting a baycom modem to work with my Kenwood. Currently I can not even monitor Packet, although I am getting strong signals. I am using a laptop running dos 5. I used setver to fake baycom into thinking it was running dos 3.3 just in case.

I made the cables myself according to the baycom manual. I am not using the interal resistor (which shouldn't be relevant to monitoring). I checked the wiring several times, and it looks good.

If anyone has experience running packet on a TH78a or with the baycom I would appreciate some pointers.

Thanks

John (KC5IFQ)

>My smail configuration was set up to mail directly to the hostname in
>preference to its MX --- wrong! This obviously dosen't work for CI$.

This isn't the way it ought to be done in any case, and any
site which prefers direct connections to the host over MX records
is broken.

--------------------8<--------(cut here)---------->8--------------------
Network Working Group Craig Partridge
Request for Comments: 974 CSNET CIC BBN Laboratories Inc
January 1986

MAIL ROUTING AND THE DOMAIN SYSTEM
[...]
Under domains, one cannot simply open a connection to LOKI.BBN.COM,
but must instead ask the domain system where messages to LOKI.BBN.COM
are to be delivered. And the domain system may direct a mailer to
deliver messages to an entirely different host, such as SH.CS.NET.
Or, in a more complicated case, the mailer may learn that it has a
choice of routes to LOKI.BBN.COM. This memo is essentially a set of
guidelines on how mailers should behave in this more complex world.
[...]
The domain servers store information as a series of resource records
(RRs), each of which contains a particular piece of information about
a given domain name (which is usually, but not always, a host). The
simplest way to think of a RR is as a typed pair of datum, a domain
name matched with relevant data, and stored with some additional type
information to help systems determine when the RR is relevant. For
the purposes of message routing, the system stores RRs known as MX
RRs. Each MX matches a domain name with two pieces of data, a
preference value (an unsigned 16-bit integer), and the name of a
host. The preference number is used to indicate in what order the
mailer should attempt deliver to the MX hosts, with the lowest
numbered MX being the one to try first. Multiple MXs with the same
preference are permitted and have the same priority.
[...]
Determining Where to Send a Message

The explanation of how mailers should decide how to route a message
is discussed in terms of the problem of a mailer on a host with
domain name LOCAL trying to deliver a message addressed to the domain
name REMOTE. Both LOCAL and REMOTE are assumed to be syntactically
correct domain names. Furthermore, LOCAL is assumed to be the

official name for the host on which the mailer resides (i.e., it is
not a alias).

Issuing a Query

The first step for the mailer at LOCAL is to issue a query for MX RRs
for REMOTE. It is strongly urged that this step be taken every time
a mailer attempts to send the message. The hope is that changes in
the domain database will rapidly be used by mailers, and thus domain
administrators will be able to re-route in-transit messages for
defective hosts by simply changing their domain databases.
--------------------8<--------(cut here)--------->8--------------------

A similar reference pops up in the O'Reilly _sendmail_ book; in
the section on how DNS relates to sendmail, there's a discussion of
some machines which use A records in preference to MX, and it also
says that's wrong. It also points to an RFC newer than the above,
RFC1123, and states "failure to obey MX records is a clear violation
of published network protocols. RFC1123, _Host Requirements_, section
5.3.5, notes that obeying MX records is mandatory."

I am a new subscriber to this forum, And want to know if there is any
HF RTTY spoken here???

I have been looking for dedicated HF RTTY operators who like contesting
and ragchewing.

I have been quite succesful contesting on HF this year and want to better
myself.

Sorry I am not into packet, don't really use my dx packet cluster in contests
even though I have it setup to run with my contest programs.

If there is any interest in RTTY out there let's get together and share
ideas, I have learned a lot for high power (1.5 kw homebrew) RTTY.

It's the best when you hear europe calling you on 40 meters, 2.5 hours
before sunset during contests.

1469. Bell packet modems - How to key?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-04 00:00:00 UTC
From: richer@cambridge.village.com
Message-ID: <3lraki$r9n@cambridge.village.com>
Source record: 44139

Greetings to the assemblage...

I've recently acquired several CODEX modems of suitable type (Bell 202/212) for use as packet modems. Once I got done drooling over my catch, however. it occurred to me that I wasn't terribly sure how to go about keying the transmitter from the modem.

My first thought was a simple VOX circuit built around an op-amp or some such and keyed from the TX line on the modem, but would that be fast enough?

Your comments are appreciated. -ajr

Chris,

You didn't give enough information to really help you but
I'll try. If you are running Linux .99 to 1.09 use the AX.25
kernel patches version 12. For this release you must also
edit the make file in .../drivers/char to build the AX.25
driver sources. If you are running Linux 1.1.54 to 1.1.59
you should use kernel patches version 26. All later versions
use kernel patches version 28. You must also edit config.in
to configure in AX.25. The AX.25 utilities (call, mheard,
axattach, axaddarp, etc) from any version will work wuth any
version of Linux.

If this doesn't help, E-mail me the error messages you are
getting and I'll try to help you out.

Best,

dave

Contact Paccomm in Florida. They have many different DCD kits
(actually, variations on the same board) that fit into many
different TNC's. I've been using them for years with no
problems in both amateur and commercial systems.

I my opinion it is good value for those who need it. It features are:

1. sharp passband filters (useful for rigs with hum and/or hiss)

2. perfect heterodyne removal

3. sharp CW filters but with some distortion. Day and night
difference for rigs without the CW filter, less so
otherwise

4. built-in speaker

I believe the distortions are a result of the 8-bit design. No one can
expect 16-bit for $80.

Subject: ANARTS WW RTTY Contest Rules

AUSTRALIAN NATIONAL AMATEUR RADIO TELEPRINTER SOCIETY

For information of all potential contestants and the Editors
of all appropriate publications. These rules may be
published at the discretion of all readers.

A.N.A.R.T.S. To be held on the week-end of
10th-11th JUNE. 1995.
WW RTTY CONTEST
Australian National Amateur
Radio Teleprinter Society.
RULES P.O. Box 860, CROWS NEST, NSW 2065.
==========

These Rules are distributed to cover the 1995 ANARTS WW RTTY CONTEST.

TEST PERIOD: Contest takes place on the second full week-end of June in each year. Contests start 0000 UTC Saturday and end 0000 UTC Monday. The 1995 contest is to be held 10-11th June.

Not more than 30 hours of operating is permitted for Single Op. Stations Non operating periods can be taken at any time during the contest.

Multi Op. Stations may operate the entire contest period.

Summary of operating times must be submitted with each contest log.

BANDS: Use Amateur bands 80, 40, 20, 15 and 10 metres.

MODES: All digital modes permitted (RTTY,AMTOR,FEC,PKT,PACTOR)
NOTE: No satellite operation permitted.

CLASSIFICATIONS: (A) SINGLE OPERATOR (One transmitter)

(B) MULTI-OPERATOR (One transmitter)

(C) SWLs

MESSAGES: To consist of RST, TIME (UTC), and (CQ) ZONE.

SCORING: For each band used - As per Exchange Points Table to obtain QSO Points. (This Table was revised 1994 and is so marked).
Count Countries worked (see definition)

Total all bands used to obtain (1) Total QSO Points.
" " " " " " (2) Total Countries.

World stations calculate "VK BONUS" which is 100 points for each VK worked on 14MHz; 200 points for each VK worked on 21MHz; 300 points for each VK worked on 28Mhz; 400 points for each VK worked on 7MHz and 500 points for each VK worked on 3.5MHz.

CLAIMED SCORE for WORLD STATIONS is calculated by multiplying (1) TOTAL QSO POINTS by (2) TOTAL COUNTRIES then THAT TOTAL by (3) the NUMBER OF CONTINENTS WORKED during the contest.(Note that each continent counts once only to a maximum of 6). To the total obtained ADD the "VK BONUS" to show GRAND TOTAL CLAIMED SCORE.

Example for World Station: 720 points from zone chart (1) X 29 countries (2) = 20,890 X 5 continents (3) = 104,400 pts

plus(+) 6 VK stations worked on 14MHz (that is 600 points)
giving a grand total of 105,000 points.

CLAIMED SCORE for AUSTRALIAN STATIONS (VK1-VK8) is calculated
by multipying (1) TOTAL QSO POINTS by (2) TOTAL COUNTRIES and
then that total by (3) the NUMBER OF CONTINENTS WORKED during
the contest with a maximum of six as stated above. This
calculation gives the GRAND TOTAL CLAIMED SCORE.

In all cases, a station may only be worked once per band, but
may be worked on other bands for QSO points and multipliers.

COUNTRIES: The country count is as per ARRL DXCC list of countries,
except that Australia (Areas 1-8), Canada, Japan, and U.S.A.
mainland DO NOT count as separate countries. HOWEVER, each
call area VK1-VK8, and each call area in Canada, Japan and
mainland U.S.A. DO COUNT AS SEPARATE COUNTRIES.
Contact with ones own country does count for QSO points but
does NOT COUNT AS A MULTIPLIER. (NOTE that call areas VK1-8,
and in Canada, Japan and USA mainland count as countries).

LOGS: Logs must show in this order:
1. DATE
2. TIME (UTC)
3. CALLSIGN OF STATION WORKED/HEARD
4. MESSAGE INFORMATION SENT/RECEIVED (RST/TIME/ZONE)
5. POINTS CLAIMED.

SUMMARY REPORT: Summary sheet must show: Callsign of station, name
and address of operator, bands used (a separate log is
required for each band), the points claimed for each band,
the number of countries worked on each band, the number of
continents worked; and details of VK BONUS calculations for
world stations. A summary of the calculations made to
obtain the GRAND TOTAL CLAIMED SCORE as per the "Scoring"
section will assist checking. The general certification
regarding compliance with rules and signature of operator is
also required.

Multi-op logs must contain signatures and callsigns of each
operator.

AWARDS: Plaques will be awarded for first place in each Classification.
Certificates will be given to 1st, 2nd, 3rd places in World and also on
a country basis (see above). The judges decisions will be final and no
correspondence will be entered into. Logs become the property of ANARTS

CLOSING DATE: Logs must be received by the Contest Manager, A.N.A.R.T.S
P.O. Box 93, TOONGABBIE, NSW 2146, AUSTRALIA, by 1st September of
the year of the contest.

Note that corrected Exchange Points Tables can be obtained from the Contest
Manager (SASE or similar appreciated) and that the Guide to RTTY Contests

published by N6GG and used by many of the Stateside magazines contains correct versions of the Table. If in doubt, we can do the scoring for you but it makes for a lot of work.

Please allow plenty of time for your log to reach the Contest Manager, last year we had logs, mainly from eastern Europe but also one from South America which took nearly six months to make the journey, by which time the results had been determined and published.

73 es Good Luck to All. ANARTS...

The Society will be very appreciative of any circulation of the above Rules carried out by recipients of this message. Amateurs in any areas could canvass their local organisations to ensure good coverage.

Hello Richard,

I have an old '88 laptop (Dual floppies, no Hard drive) that I have been
using just fine running Baycom software and homebrew "baycom" modem.
Several hams in the area use the older '88 cpu's using the BayPac modem
from Tigertronics. We all love our baycoms! Plus they only cost about $50 :)

Hope this helps.

From: pschleck@gonix.com (Paul W Schleck KD3FU)
Subject: Recruiting Elmers from the Internet

As readers of the rec.radio.amateur.* newsgroups are probably aware, I maintain a periodic information posting known as the Amateur Radio Elmers Resource Directory (aka the "Elmers List") which provides a list of net Elmers, indexed by topic, and their E-mail addresses. (For users of threaded newsreaders, this article is linked to the base article of the Directory itself).

As noted elsewhere, the Amateur Radio Elmers Resource Directory is 4 years old as of last month. In order to maintain its value to the net, I have strived to keep it accurate and up-to-date. In addition to reviewing the currency of the entire list every 2 years, I am constantly scouring the newsgroups for new Elmers to join the list.

There's always been an implicit invitation for any qualified person to join the list. However, since I've lost about 1/3 of the list due to attrition from my last biannual mass-ack (i.e., no response at their last-known E-mail addresses), felt the need to send out this explicit invitation. I'd like to replace the lost Elmers with new, motivated, quality Elmers from the net. Areas of expertise that are most desirable for the list right now include:

- Military Affiliate Radio System (MARS), particularly Army and Navy/Marine-Corps. MARS (as I currently don't have any MARS Elmers from those branches)
- Advanced homebrewing techniques (surface-mount, VLSI, DSP, spread-spectrum, etc.)
- TCP/IP Packet Radio and Gateways/Internetworking (particularly local IP coordinators and/or subnet managers/operators/leaders)
- Amateur Satellites/Space Operation (particularly Microsats and SAREX)
- Amateur-related Software for Unix/PC/Mac/Amiga/Psion/HP-95
- College Clubs and organizational guidance/strategies
- Boy Scout Amateur Radio Merit Badge Counselors
- Unix/Linux/X-Windows programming and configuration
- Amateur Radio Organizational Contacts (I am especially looking for contacts for the ARRL Field Organization, GRAPES, AMSAT, QCWA, QRP Int., NARA(?), QRZ, CSVHFS, LAMBDA, ARES, RACES, FEMA, any state OES or EMA, as well as any regional frequency coordinating body)
- Band, Mode or, Brand-specific equipment (actual manufacturer or dealer contacts would be quite welcome, as long as they reveal their affiliation and at least provide *some* free services)
- Maintainers of unique amateur-radio-related anonymous File Transfer Protocol (FTP) sites and World-Wide Web (WWW) Home Pages (as opposed to those that are substantially a rehash of, or pointers to, existing sites).

- Maintainers of unique amateur-radio-related mailing lists
- Editors/contacts for amateur-radio-related publications

Although expertise in any other area would, of course, be welcome also.

I'd like to emphasize that participation is totally voluntary, with very minimal obligations (1 or 2 polite inquiries a month, if feedback from existing Elmers is any indication). If you find that it is too much work, you are welcome to bow out, no questions asked. In the 4 years I have managed the list, only a handful of Elmers explicitly resigned, and usually only because of severe professional or personal obligations, or their interests or expertise changed. You don't even need access to netnews, just a reliable E-mail address.

I've also attempted to seek out people on the net who I think would be good Elmers. If you've received a personal E-mail invitation from me, I urge you to give it serious consideration. The net would appreciate your volunteerism.

If you'd like to volunteer, or just discuss further what volunteering would involve or if your contribution would be desirable and fit within the Elmers List's mission and editorial policies, send me some E-mail to the Elmers list administrivia mailbox below (the default Reply-To: of this message; an autoreply daemon will respond with an acknowledgement message and I'll be in touch with you personally very soon).

If I'm not mistaken, KAGOLD does not run on a Mac. It's PC software, is it not?

The answer to your question about MacRatt Bob is no. The Kantronics Host Mode (used by HostMaster) is not compatible with AEA's Host Mode (used by MacRatt). As I recall Kantronics may have an old WeFAX application available. In general wefax reception is less than ideal with a KAM because the KAM does not have gray scale capability.

FYI - I'm the author of the Kantronics HostMaster for the Mac (but *not* the PC!). I'm also working on an AEA tnc host mode application. If anyone has comments or suggestions regarding Macintosh software, feel free to send email to me at the following address:

|> does this work?

SCADA (System Control And Data Acqusition) is a Substation Control package. It runs over microwave or 800
MHZ systems. As far as the installations I have seen it does not run OVER high voltage lines. It is used to switch
circuit breakers and load balance plus read the power, voltage, and current reading from a substations. Our local
natural gas company uses a pipeline SCADA for compressor/distribution control for gas pipelines.

1482. Packet Into Internet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-05 00:00:00 UTC
From: aa005@torfree.net
Message-ID: <D6KFKD.J1x@torfree.net>
Source record: 44065

I am involved with a free community network (the Toronto Free-Net), and one of the things I would like to do/offer is feeding packet radio material into an internet newsgroup. This would be a one way feed (I don't want the hastles of attempting to sort out which of our users have valid licences and who doesn't). I want to know if anyone else has done this?

This will offer people another source of info, and I hope get more people interested in ham radio.

The problems I see are along the following:

- I have not yet tested the room that we use for our modems/terminal servers, but I expect that they will be an RF disaster area given the amount of electronics in the room. Running an antenna out of the room will be a problem, as the space is donated to us. We could alternatly set the radio up at one of two other locations, one at a University (where security may be a concern), or at another larger (and more RF prone) data centre.
- I would ideally like a situation where the TNC is tied to scanner, rather than a transceiver, so that there would be NO possible physical way that someone without a licence could hope to transmit. What sort of trouble am I asking for when acknologements can't be sent?
- What sort of a filtering job would I be looking at between the T.N.C. and the internet box? Getting the likes of an old 8088 based PC is NOT a problem here, getting a low-end '386 to do this can also be done. But has anyone else done it?

Haai all,

I've a friend who's working with a baycommodem and G8BPQ. Therefore he uses the bpqax25 driver. When he's transmitting more than one frame the transmitter wait for a moment between the frames. In that time another station will take over the frequency. So when he's starting to send again he's sending thrue the other station.

Does someone know a solution? Or is there a working driver for it?

Thanks in advance!

Greetings,

1485. Re: ax.25 with Linux

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-06 00:00:00 UTC
From: craybb@unidhp.uni-c.dk
Message-ID: <3m04ob$94u@news.uni-c.dk>
Source record: 44068

Chris, N0WHI, has asked if anybody has had success with AX.25 in Linux.

I have successfully installed the kernel modifications and user utilities from sunacm.swan.ac.uk and used them for terrestrial packet.

My Linux is 1.1.59 from the Slackware 2.1 distribution. The kernel patches are AX25-026 and the utilities are from AX25-022.

Be carefull when unpacking the sources. The writeup and the actual tar file does not agree. Do a tar -t (test) on the source file to find out where to unpack the sources from.

My first kernel build failed and I had to add a definition for the T2-timer (ax25_t2) in
/usr/src/linux/net/inet/sock.h

I added it between ...t1 and ...t3 to make it compile. From then on it was downhill.

Hope this helps you through, otherwise contact me by e-mail.

1486. Baycom Modem from R & R Associates: Be Ware

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-06 00:00:00 UTC
From: rdonnell@mail.eskimo.com
Message-ID: <D6Lt4D.KBF@eskimo.com>
Source record: 44069

Hello All,

Be aware that you should check the frequency of the crystal supplied if you order a Baycom modem kid from R & R Associates. While the kit is an excelent value, the crystal that I (and 2 friends) received in our kits was incorrect.

The first thing I noticed was that packets originated by the modem sounded 'low in pitch'. It took about 2 hours of head scratching (and measuring the audio tones) to confirm the problem, then stumbling across the error in crystal frequency between the marked value on the crystal and what was on the schematic.

The TCM3105 modem chip uses a PAL color burst crystal, which is 4.433 MHz, approximately. The crystal shipped in our kits is 4.194 MHz. The 5% error in frequency is enough to make for poor decoding of packets on receive, and the TCM3105 on my DRSI card completely ignored packets from the Baycom modem.

I found that I had an antique 6 meter crystal for 53.2 MHz whos fundamental was less than .01% in error from the PAL color burst frequency, so I went with that. What luck!

The modem's reception improved immediatly, and now other stations that would not copy my 10 watt transmitter, could copy my HT with 1/4 watt.

I've not been in touch with the proprietor of R & R Associates, however a letter will be going in the mail soon to see if he will make good on his kit. I hope so, and if this oversight is corrected, I'd recommend the kit as an excelent value for beginning packeteers and those needing to have a portable packet station using a laptop.

I had no problem getting the supplied Baycom software running, and also grabbed the AX25 <-> packet driver program from N8WEI's FTP site, and had JNOS running pretty painlessly too.

My only other gripe is that the instruction sheet supplied with the modem kit - what you have to use to assemble the modem PCB - is a nth generation photocopy, and is hard to follow. I'll probably see about offering a redrawn/typed version to R & R if replacement crystals are forthcoming.

73, Bob

: any Vendor suggestions? Brands, models etc. very appreciated.

You don't say what the application is, but it sounds like you just want an on-off application; you also don't say whether this is to be relatively unobscured, or through buildings and so on. If unobscured, more or less any system will reach that range, IMO.

In this country, wireless doorbells are sold (both on saving wiring and on being able to carry the receiver, e. g. into one's garden). I wonder if one of these might be modifiable (don't know if modifying just to the extent of replacing the switch with something would void type-approval, though).

From: wmd@mbunix.mitre.org
Message-ID: <3m1c02$apr@linus.mitre.org>
Source record: 44073

I currently have both a 2M transceiver as well as an IBM-PC (DOS) with an available RS-232 serial port. I am new to packet-radio and am looking to select a TNC that will allow me suitable performance.

I understand that a built-in 1200 baud modem is common at this date and will be so into the near-distant future (please correct me if this is not so). I would like a full implementation of AX.25 Version 2 and TCP/IP protocols as well as a suitable interface program for the IBM-PC. As I understand, I would like a firmware implementation of the link-level protocol rather than a software implementation. I have no reason to believe I will be needing a dual-port TNC. I may be interested in HF packet in the future.

Given the above, I have found that AEA and Kantronics offer TNC products in the $100 to $150 (new) price range that should satisfy my needs. I am looking for any comments that may aid my selection.

: Please reply. Thanks, Jeff

I'm assuming that you are talking about the use of your local
bbs. To send a message to an indivdual use the
sp callsign @ hisbbs

where callsign = the user you are addressing to
hisbbs = the home bbs that "callsign" uses

If both users are on the same bbs just use
sp callsign

To send a message (sale, help, etc.) to many people
use the
sb sale @ epa

command. The "epa" part limits the distribution to the
epa area. So check the local bbs and look for the local
desiginators for your area. Please don't use "@ ALLBBS"
for messages that have never been routed locally first.

There are other variations on the addressing and some
bbs's may even have other commands but this should
get you started.

John

Well, I cant tell you much about equip/etc since I dont have my license yet - in 2 weeks I take my Technician Plus test. But, I can definately suggest finding a local HAM club, and going there - usually they have classes, and the club mettings are usually informative.

Also, the book "Now Your Talking" by the ARRL is VERY good - this is what im using to learn in the Marlboro Amateur Radio Assoc. Club classes that are held on saturday (in Marlboro, MA).

I suggest you do the code if you go for your license though!

From: Oneil_Dumont.sit.ulaval.ca
Message-ID: <D6o5DD.H60@athena.ulaval.ca>
Source record: 44079

I am currently experimenting with Wavelan cards to link remote buildings to the Laval university network (Quebec city). While the cards do the job very well as far as radio transmission is concerned, the cost of reliable and high performance software has proved too high. The main raison this is so is our multiprotocol environment. There is another alternative which consists in using existing equipment (we already have it) that would normally work over fast telephone lines and replace the conventional modem by a wireless unit. So I am looking for fast wireless modems that would work in spread spectrum at 915 MHz with a 0.25W to 0.5W transmitter. I need at leat a 500 Kbits/sec. throughput. I would appreciate suggestions. Thank you for your help.

Hi guys!
How about a little help for a couple of little lost sheep who are (probably) going astray. We are attempting to get some 9600 baud packet activity going on here in Panama. The problem is that we are both rookies at this speed. Henry, HP1CDW is running a PK-900 and I am running a PK-96 into an azden 9600D. The problem is we cannot connect. I guess the question is: What the heck does 9600 sound like? I can hear definite tones from the PK-900 but the PK-96 seems to make only whilte noise at any deviation. level. Which one is sounding good? The 1200 baud from the PK-96 works fine (same for the 900) so we know the cables are properly wired (AFSK output comes from the same pin, no matter whatthe speed). No one here has ever run 9600 so we have no leareeee lead to follow. Appreciate any help we could get. TNX

Hi Otto,

I have some of the answers for you.

9600 sounds like white noise (hiss).

You probably will have to wire the 9600 directly into your radio to the varactor. You can not take audio from the speaker jack and put it in at the mic jack for 9600 baud. The pre-emphasis and de-emphasis in your receive and transmit path distort the wave shape at 9600 baud.

If you are luck someone on here will know how to connect the cables for your Azden. The other option will be to get a 9600 baud ready radio. Kenwood's are the best.

Good luck,

Bill

1502. Re: Kantronics Email address?

Hello!

I'm a newbie to packet - just tried it out last night. I've got one of these old PK-80 packet controllers and (at the other end of the technology spectrum) a Macintosh Quadra 840AV. I'm using an old Heathkit 2M transciever.

My first time on I managed to communicate with no one. Mostly, I've been trying to figure out how toe *use* packet. I can get into the local PBBS (WA2SNA) and see the nodes. I can connect to other nodes, and clog up the network by connecting to other nodes ;-) . I can see the most recent users. Etc. But I don't really understand the network (how to connect to other stations, how to go through gateways (what gateways *are* !), etc.

Also, I'm working at 1200 baud. Is it not possible to work at higher baud rates on 2 meters or must I work in the GHz range for 19200?

Is there a good FTP site I can find *current* FAQs and info on using packet? Is there a web page?

Thanks!

Tom

Message-ID: <3m6cpc$kof@ccnet.ccnet.com>
Source record: 43991

I have both a Kantronics KPC3 and an AEA PK232. I like them both (although I doubt that the PK232 is the one you are looking at if you are in the $150 range). I found the KPC3 to be excellent for a small, low power, tnc. I've used it for AX.25 and now use it full time on my TCP/IP node. No problems with it at all. It can be made to operate on an internal battery, which is an added bonus if you intend to go into the field with it. You can upgrade the message memory on the KPC3 to 512K if you want to use it for a personal AX.25 PBBS.

One comment - Kantronics now has a KPC9612 TNC which gives you 9600 and 1200 operation in the same size box as the KPC3. You might think about spending the extra money and getting that system - as some of the local packet networks move to 9600, you will be able to move with them.

One other comment. If you ever intend to move to other modes, such as PACTOR, AMTOR, RTTY, WEFAX, etc, you might think about other TNCs that have that capability, such as the KAM or the PK232. Again, it's a matter of "future proofing" your station so that you can move to those modes without having to buy new equipment. The KAM also has the added advantage of being able to operate two ports simultaneously.

That's my 2/$1.00 worth!

Lan-Link has a "robot" mode where you can just turn it on and let it
run while the operator watches :-). You might have a look at that.
BTW - robot modes in normal operating times are *very* antisocial!

Try looking at ftp-os2.cdrom.com. On there you will find a file named THS403.zip
This is a program written for the TNC-2 using WA8DED host mode software. Have
also found a program called FPAC.ZIP on a German Site, can't remember the name
of the site right now, but FPAC is a nice piece of work, it works with a TNC-2
using TF roms (a european adaptation of WA8DED host mode (I think)). And the
last one I know of is PMNOS version 1.1, it is a nice NOS program for use with
OS/2's presentation manager. Again don't know where to find it on the net, haven't
been on here long, but have done a lot of packet playing with my OS/2. Hope this
helps. Good Luck, es 73.

1510. Which controller to buy??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-08 00:00:00 UTC
From: hmm@netcom.com
Message-ID: <hmm-0804951424500001@192.0.2.1>
Source record: 43995

I am in the market to buy a multi-mode controller.

So far, ive looked at the MFJ, AEA, and KAM models.
My price high is about 400 bucks.

What do you recommend?

Please help.
Thanks!

1511. Mfj-1278

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-08 00:00:00 UTC
From: per.flitt@swedx.ct.se
Message-ID: <254bdf8d@swedx.ct.se>
Source record: 43996

Hi !

I've been using the MFJ-1278 for a number of years now and altough
it works great for 2 meters it's on shortwave i want to use it.
I have, however, a number of questions regarding this machinery:

- My mailbox sends/receives only 7-bit Ascii (not 8-bit) and the
values of Awlen/8bitconv don't seem to matter. Is there a way
to fix this ?

- The modem tone pairs are a bit "peculiar" with only 1000/850 and
200 Hz shifts available. The "peculiar" bit about them are the tones
they use: 2975/2125, 2310/2110 and a bit better 2200/1200.
My objection to this is the fact that my rig, a Kenwood TS-140S,
cuts/lowers frequencys close to 2500/3000 Hz and i would like to
have the tone pairs in the middle of the audio spectrum. Is it
possible to readjust ?

- When using the TNC for 2 meters i have to disconnect the shortwave
because it causes a whole bunch of retries on weak signals.
I use port 2 for 2 meters and port 1 for shortwave. Can i in any
way fix this ?

- The tnc is a huge transmitter of RFI and i use shielded cables and
good earthings to keep it down but i'm not really satisfied with it.
Should i put the tnc in a copper-box or is there some kind of cure ?

- My impression of using it for listening to RTTY stations when compared
to Hamcomm 3.0 is not very nice for MFJ. Hamcomm needs pretty strong
transmissions (when compared to a Harris RF-5710 modem) but that's
nothing in comparison with the MFJ. Could my 1278 be in need of some
realignment/repair or what's going on here ?

Hope you know how to help me !

RUH-compatible 9600 packet sounds much like gentle white noise, and is quieter and 'softer' sounding than the background squelch noise. It has absolutely no trace of tones etc. detectable by the human ear; you just can't believe it's packet! Sounds like the PK900 isn't set up right, and is sending 1200, or maybe even something entirely different, hi.

You may need to play around with equalisation to get two 9600 stations to 'talk' to each other satisfactorily. Once you've done that, the problem starts all over again when a third station joins in the fun and games! 9600 is 8 times faster than 1200, and sometimes I think it's also 8 times more difficult. Setting up both ends of a dedicated link isn't too bad; you can do it all 'on the bench' before taking the equipment out into the field. Tweaking several different sets of base station equipment by trial and error isn't nearly so straightforward!

Keep the deviation modest, and well within the bandwidth of the receivers.

Bon chance!

My mistake about the part 95, but it still said that other operations
were allowed, and it was a condensed version of the FCC rules. Check your
local Radio Shack for a copy of the little white sheet. I could be wrong,
since the CB I used to have was about 3 years old. 73 de Curtis

Subject: Baycom Modem from R & R Associates: Be Ware

Hello All,

Be aware that you should check the frequency of the crystal supplied if you order a Baycom modem kid from R & R Associates. While the kit is an excelent value, the crystal that I (and 2 friends) received in our kits was incorrect.

The first thing I noticed was that packets originated by the modem sounded 'low in pitch'. It took about 2 hours of head scratching (and measuring the audio tones) to confirm the problem, then stumbling across the error in crystal frequency between the marked value on the crystal and what was on the schematic.

The TCM3105 modem chip uses a PAL color burst crystal, which is 4.433 MHz, approximately. The crystal shipped in our kits is 4.194 MHz. The 5% error in frequency is enough to make for poor decoding of packets on receive, and the TCM3105 on my DRSI card completely ignored packets from the Baycom modem.

I found that I had an antique 6 meter crystal for 53.2 MHz whos fundamental was less than .01% in error from the PAL color burst frequency, so I went with that. What luck!

The modem's reception improved immediatly, and now other stations that would not copy my 10 watt transmitter, could copy my HT with 1/4 watt.

I've not been in touch with the proprietor of R & R Associates, however a letter will be going in the mail soon to see if he will make good on his kit. I hope so, and if this oversight is corrected, I'd recommend the kit as an excelent value for beginning packeteers and those needing to have a portable packet station using a laptop.

I had no problem getting the supplied Baycom software running, and also grabbed the AX25 <-> packet driver program from N8WEI's FTP site, and had JNOS running pretty painlessly too.

My only other gripe is that the instruction sheet supplied with the modem kit - what you have to use to assemble the modem PCB - is a nth generation photocopy, and is hard to follow. I'll probably see about offering a redrawn/typed version to R & R if replacement crystals are forthcoming.

73, Bob

From: wmd@mbunix.mitre.org (William M Driscoll)
Subject: TNC purchase (AEA or Kantronics)

I currently have both a 2M transceiver as well as an IBM-PC (DOS) with an available RS-232 serial port. I am new to packet-radio and am looking to select a TNC that will allow me suitable performance.

I understand that a built-in 1200 baud modem is common at this date and will be so into the near-distant future (please correct me if this is not so). I would like a full implementation of AX.25 Version 2 and TCP/IP protocols as well as a suitable interface program for the IBM-PC. As I understand, I would like a firmware implementation of the link-level protocol rather than a software implementation. I have no reason to believe I will be needing a dual-port TNC. I may be interested in HF packet in the future.

Given the above, I have found that AEA and Kantronics offer TNC products in the $100 to $150 (new) price range that should satisfy my needs. I am looking for any comments that may aid my selection.

: Yes. You will need a tnc. The dsp-93 is simply a multipurpose
: modem.

You can;t just call it a multipurpose modem -- either. It is capable of doing lots more than just mode functions.

Anyway -- currently, anything that requires a HDLC encoding/decoding process will require an external TNC.

A DSP-93 TNC plugin board to the design is currently under board layout. Hopefully by the end of the year (hopefully sooner) the tnc-95 kit will be available that willfit inside the dsp-93 box.

Greg

1521. TAPR Information and Internet Access

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-09 00:00:00 UTC
From: gjones@tcet.unt.edu
Message-ID: <3m9bm8$gs3@hermes.unt.edu>
Source record: 44004

Periodic Announcement - TAPR Information and Internet Access

Greetings from TAPR!

TAPR can be reached via the Internet. The Automated Information Server that TAPR provides allows anyone to request information on TAPR, products, newsletters, and lots of other files. To find out more about this service, send an e-mail message to listserv@tapr.org with the subject line "Request" and the following text in the body of the message:

help (for a brief set of instructions)
index -all (for a list of all file by topic area)
list (for a list of TAPR Mail Groups)
get tapr taprinfo.txt (or info on TAPR)

In the above message example, "help" retrieves a brief set of instructions for info, "index -all" retrieves a list of available files by topic and "taprinfo.txt" retrieves a text file containing information on TAPR and what TAPR is all about. If you want to retrieve several text files with one message, use a separate line for each "get filename" request.

General Information:

* Ever heard of a TNC ?

* Interested in general packet radio information?

* Interested in high-speed packet operations?

* Interested in other types of digital communications?

* Interested in experimenting or building kits?

* Interested in keeping up-to-date on national digital and packet issues?

Then you might be interested in TAPR!

Goals:

% Support Research and Development efforts in the area of amateur digital communications

% Disseminate information on packet and digital communications

% Provide affordable and useful kits for experimenters and hobbyists

% Pursue and help advance the amateur art of communications through publications, meetings, and standards

History:

If you have used a packet radio TNC, then you are already a part of TAPR history.

The TNC (Terminal Node Controller) project grew from a discussion in October of 1981 at a meeting of the Tucson Chapter of the IEEE Computer Society. A week later, six of the attendees gathered and discussed the feasibility of developing a Terminal Node Controller that would be complete and available to amateurs at a modest cost. This was the genesis of TAPR.

On June 26th 1982, Lyle Johnson, WA7GXD, and Den Connors, KD2S, initiated a packet contact with the first TAPR unit. The project progressed from these first prototype units to the TNC-1 and then finally to the TNC-2 which is now the basis for most amateur packet operations worldwide.

TAPR was founded in 1982 as a national organization with interests in the areas of packet and digital communications. Today, TAPR continues as a membership supported non-profit amateur research and development organization. TAPR currently has more than 2000 members, worldwide. TAPR continues to develop kits for the amateur community and is working actively on publications and communications standards.

Membership:

Membership in TAPR includes a subscription to the quarterly published Packet Status Register newsletter. PSR has been published since 1982 and is recognized as an authoritative source for up-to-date user and technical information on packet radio. Much of the material in PSR is timeless. Back issues may be obtained from the TAPR office. Membership in TAPR is $15 for one year. In Canada and Mexico membership is $18 and outside North America they are $25.

Join the amateur digital-revolution -- Join TAPR!

Special Interest Groups

TAPR maintains several SIGs in various areas. To get the latest list of SIG groups, send an e-mail message to listserv@tapr.org with the subject line "Request" and the following text in the body of the message:

list (for list of mail groups on TAPR.ORG)

To request the information on any mail group, send an e-mail message to listserv@tapr.org and in the message text include:

information listname (where listname is the name of the mail group)

When you are ready to subscribe, send e-mail to listserv@tapr.org with the following command in the message text:

subscribe <list> <your name>

List should be the name of the mail list you want to join and Your Name
should be both your First and Last Name.

Current SIGs include:
NETSIG Regional Networking SIG
BBSSIG BBS SIG
HFSIG SIG on HF Digital Topics
DSP-93 SIG for those that are building TAPR/AMSAT DSP-93 kits
APRSSIG SIG on APRS

FTP users

The TAPR Software Library is now available via anonymous FTP. You can
access the library by ftp access to 'ftp.tapr.org' in the directory
/tapr. Login in as 'anonymous', with a password of
'your_account@internet_address'.

Packet Raido and TAPR is on the World-Wide-Web!

The series is accesible through the Packet Radio Home Page at this
URL:
http://www.tapr.org/tapr

What's here? A page of links (the Home Page), the TAPR Home Page, a page of
Packet Pioneers and Contacts, a hypertext packet primer and FAQ, and more.

Thanks to Howie, N2WX, for his support and invaluable contributions of
the TAPR page.

I recently bought a Kam Plus. It's a very nice unit - easy to setup and operate. I've use it on VHF packet and on HF on RTTY, Pactor, and Amtor. Haven't tried G-Tor yet. The unit costs about $300. The software to run HF and VHF simultaneously will run from $0 (for shareware) up to abt. $100, depending on what you get. Good luck on your choice. Most people seem to be very satisfied with the Kams.

Has anyone out there hung outboard memory on this lil' board (TI's c26 DSK.) I've been using mine to generate incredibly narrow bandwidth cw and rtty filters and am thinking of making the board a standalone unit i.e. not reliant on my mac to download the filter code each time I run it. So I'm looking for a schematic or perhaps pointers to recent articles or app notes which detail how to do it. Would also be interested (more so actually) if someone knew of some commercially available add-on. This info would be MUCH appreciated. Thanks in advance.

1525. Baycom 1.6 and 9600bps modems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-10 00:00:00 UTC
From: cusick@dstos3.dsto.defence.gov.au
Message-ID: <1995Apr10.151625.1@dstos3.dsto.defence.gov.au>
Source record: 44008

I attended a local swap meet recently, and a trade dealer was selling copies of BATCOM 1.6 for AUD$ 45 a copy. For this, you got a floppy and a printed bound manual. The dealer tells me that this version does support 9600bps operation via the parallel port, but will only connect to the BAYCOM 9600bps modem (due this month) for around AUD$200. I am lead to believe it is meant to be a closed arrangement, and BAYCOM 1.6 cannot be operated with other modems at this speed.

It appears the 1200 bps mode operates via the serial port as per the earlier versions.

Is this the case, or has anyone successfully used another modem with this software ?

: |> does this work?
As was also mentioned SCADA is a method of controlling remote sites and getting data/information from these sites. The communications techniques vary from radio, hard copper pairs/wires, IR, and there as some used by the power companies that put the data directly on the power lines. I'm sure you have seen the X-10 modules that are used to control lights, and stuff in the house from a control box, it works the same way. X-10 uses control data impressed on the house wiring to operate the various relays, dimmers, and control devices. Check Radio Shack, ask about X-10 modules. There are major commercial companies that use this technique, it's downfall is it won't go through a transformer.

From: pws8157@ucs.usl.edu
Message-ID: <3mamr8$p0i@rouge.usl.edu>
Source record: 44011

I'm running a PBBS using BPQ v4.08a and FBB v5.15c.

The "id" broadcasts and "nodes" broadcasts work just fine. What I can't get to work is the "mail" broadcasts which are supposed to be sent out to those call signs who have unread local mail.

My BBS callsign is "KA5NMN" and the digipeater used is "AB5CV-3".

The TNC monitor shows:

"[1] fm KA5NMN to MAIL via AB5CV-3 ctl UI^ pid f0"

It sends out the broadcasts on time. It just doesn't include any info!

Any help, comments, suggestions would be most appreciated! Thanks!

Yup, I'd agree with that. I've been running a KAM-Plus since they first came out, and it's since been upgraded to v7.1 firmware. I get many people asking me to solve problems with their TNCs or multimode controllers, so I get to play with many different types. I always find the Kantronics firmware and hardware much more logical, friendly and stable than the others, though I *do* wish they would add the SR (Send Reply) command to the packet PMS, and allow multiple kills (K msg#1 msg#2 msg#3 etc.) instead of having to choose between killing the whole lot (KM) or killing each one individually.

Also, the arrangements for monitoring G-TOR ARQ transmissions is pretty dismal, as they ran out of room in the ROM to put the code! Ah well, can't have everything I suppose. The mode itself goes like an express train on a decent clean frequency; well worth a try.

The v7.1 firmware allows the unit to be on standby and to respond to a call on AMTOR, PACTOR *or* G-TOR. This is utilised by the GB7PLY BBS in Plymouth (extreme SW on UK mainland) on 40m, so you can do your own comparisons. You can also log into the FBB BBS mailbox, or go through the local packet nodes and surprise an unsuspecting local! Maybe there are some 'multimode' BBSs like this in the USA for you to try?

Finally, Kantronics equipment seems to be half the size (or less) than everyone else's, yet it isn't particularly crowded inside. AEA stuff seems very bulky; I though the PK232 was bad enough, but the PK900 is monstrous! Why???

1531. Probs using KAM+ w/ FT-990

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-10 00:00:00 UTC
From: hamilton@BIX.com
Message-ID: <hamilton.797539928@BIX.com>
Source record: 44014

Oh, my! I'm getting frustrated with my KAM Plus, the complete lack of documentation and with Kantronics pleasant but not very knowledgable tech support. Perhaps someone here can help me answer these questions, which are driving me nuts.

First, here's my configuration:

Yaesu FT-990 KAM Plus with the 7.1 ROM

Wiring of connectors, per instructions from Kantronics tech support:

RTTY Connector:
Pin 1 Shift <---- Pin 5 FSK: FSK Out (red)
Pin 2 RX Out ----> Pin 6 RCV: Rx Audio (purple)
Pin 3 PTT <---- Pin 3 PTT: Push to talk (brown)
Pin 4 GND <----> Pin 2 GND: Ground (black)

Packet Connector:
Pin 1 Data In <---- Pin 1 AFSK: Tx Audio (white)
Pin 2 GND <----> Pin 2 GND: Ground (black)
Pin 3 PTT <---- Pin 3 PTT: Push to talk (brown)
Pin 4 Data Out ----> Pin 6 RCV: Rx Audio (purple)
Pin 5 Busy (Not connected)

The terminal emulator program is just the standard Windows Terminal program, setup for control keys to be passed thru to the KAM.

I've been using the RTTY/LSB mode on the 990 with the KAM for RTTY/Amtor/Pactor.

1. Is there any way to invert my RTTY TX signal without affecting either RTTY RX or any other mode?

I find that with Amtor/Pactor, I can connect just fine but on RTTY, I can copy the other end, but when I send, I'm told (and am inclined to believe) that my mark and space are reversed. If I use the <Ctrl-C>-I (invert) command before sending, I'm told my signal is correct, but this inverts my reception also, producing garbled copy at my end.

I see in the manual that the FSKinver command can toggle the sense of just the FSK (tx) line, but the manual does not make it clear (and tech support was no help) whether this will affect only RTTY or also the Amtor/Pactor modes. My expectation (but haven't had a chance to try it yet

as the bands aren't open right now) is that it's going to affect everything, which is not what I want. Comments?

2. What is the story on normal vs. inverted mode? In the ARRL's "Your RTTY/AMTOR Companion" by Steve Ford, the comment is made (pg 3-3) that "the RF frequency of the MARK signal is usually higher than the RF frequency of the SPACE signal." The default of the Kantronics (unless reset with the LOwtones command) is to have SPACE above the MARK. I presume these are consistent positions when using LSB, i.e., that in LSB, the higher audio frequency corresponds to the lower RF frequency. Is that correct?

3. Is there any way to get the KAM to echo <Ctrl-H> (backspace) when it's not able to do the local edit?

I have the KAM set to echo back to the terminal. And if I press backspace before it's sent the data, the KAM will, just as documented, echo back a <Backspace><Space><Backspace>. But if the data's already sent, the backspace apparently is sent, but not echoed, so the result looks right at the other end, but not on my screen. Worse, because there's really no way to know what's already been sent, I really never know what will happen on my screen when I press backspace. In my judgment, this "feature" of the KAM is just idiotically designed; the question is just whether there's any workaround.

I tried, as an alternative, setting local echo in my Terminal program and turning echo off on the KAM. But this doesn't seem to work:

a) Typing a command + <enter> causes the KAM to do what I asked, but there's no line feed after the command, so any new output from KAM immediately overwrites what I've typed.

b) Setting terminal preferences to CR->CR/LF outbound in the terminal program so I'd hopefully get that new line doesn't work at all: the KAM refuses to recognize the command and is sort of "hung" 'till I reset that outbound conversion, at which point I get a long string of "Eh?" responses before it comes back to the prompt.

(When I try discussing this with Kantronics' Tech Support, it gets frustrating really quickly when they tell me I should talk to Microsoft about Terminal!)

4. Is there anyone who's made any sense at all out of the BBS functions? (Need I say more on this point?)

5. What exactly does the AM/FM switch on the KAM really do, besides just take up space? I can't determine that it has any effect on anything and the Kantronics Tech Support

folks seem to agree.

6. I'm told there's a program called XPKAM by Gary Johnson, KF7XP, that works very well with the KAM+. Comments from anyone using it? Also, is it shareware here on the net or must it be ordered directly from the author?

7. Is there a better book out there than that dreadful POS that Kantronics ships with the KAM as a so-called "Reference Manual"? That darn thing does barely more than just list the commands. There's not even a breakdown showing what commands affect what modes. The "RTTY/AMTOR Companion" and "Gateway to Packet Radio" are good general books but hardly useful with specific questions about the KAM.

Hi there...

Here in Sydney, Australia we have worked out that BAYCOM is a dead piece of software. We can run TPK at 4800 THROUGH the serial port with NO tnc.

I believe AX25EXT and one of the other extensions allow the 4800 bps to run just like 1200.... But you need a 286 or better to run it.

4800 Baycom Style sounds different from 4800 TNC because the Baycom style shares the 1's between the sync fields.

The Fisher'S Ghost Amateur Radio Club is actually producing a 4800 BPS Baycom Style modem as PCB, KIT or Built.

And we are encouaging users to use 4800 unlike the rest of the Sysops in our area who thing 1200 is fast.

As for 9600 Baycom, Watch out through the serial port - a 386 could cope with the speed I am 99.99999 % sure, BUT the problem is that most 9600 need a TX and RX clock of 16* the 9600. Unless you build a PLL it wont work baycom....

Greetings,

I have a question that no one seems to be able to answer sufficiently, so hence, I pose it to the group.

Is there a reference in part 97 that specifically states that prohibits radio amateurs from using a protocol that is not AX.25?? For example, can I use straight TCP/IP or better yet, can I devise my own protocol and put it on the air as long as I make the protocol public (no fun packeting to your self regardless of the protocol??) Maybe this is a FAQ? I am looking for specific referencs if anyone has one!!

Thanks

1534. 2Mbit via 3 Cms

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-10 00:00:00 UTC
From: darren@g7lwt.demon.co.uk
Message-ID: <797549401snz@g7lwt.demon.co.uk>
Source record: 44017

Hi,

For the past two months I've been running a 2Mbit link over an eight mile hop from Manchester to Rochdale (UK). We are using gunn diodes with 10mw into flate plate antennas (Squarials) with approx. 30 dBs of gain. The first attempt was 3Cms + 24Cms crossband but the high power radar 100Kms away caused too much interference.

The link is an E1 presented as X.21. At first we only had access to Spider R185 remote bridges that could run at 128k max. A 12.5 Mb file took 16 mins to copy from one PC to another (Netware Lite). I've had to return the Spider bridges now and have two 3Com Netbuilder Remote Office 200s on loan. These units can run the X.21 port at 2 Mbits and now the same file transfers in 1 Minute 34 seconds (8 seconds slower than a local PC to PC transfer using a thinnet segment and Windows for Workgroups 3.11).

The bad news is that the bridge hardware must be returned in a couple of weeks. :-(

I am looking to beg/borrow remote bridges and data/voice muxes that use X.21 at 128k or higher. (I can run some equipment at 64k though !) Alternatively devices that talk G.703 directly. I travel all over the UK (From Aberdeen to Bracknell) and could arrange collection of any old equipment that is being ditched. :-)

I'd like to think that a 2Mbit backbone up the country could provide a good start for a sensible packet infrastructure with the possibility of providing voice circuits for repeater linking/trunking. (BBSs and nodes would access at 64k+) In the not too distant future the same sort of pipe could be used to interlink ATV repeaters by using MPEG encoding.

The other snippet of news is that G8GHO located in South Manchester has successfully generated teletext in the vertical blanking interval of 3Cms ATV transmissions using home brew equipment (based on his own custom EPLD). The text can also be run in full screen mode with a data rate of 4+ Mbits.

Did anyone get to the bottom of the Dutch conversation about 2Mbit working ? When I worked for Philips all my colleagues spoke many languages including English so I only ever learned the most basic greetings.

Regards

Darren (G7LWT)
PS. Anyone know if this is a first for E1/Megastream/Ethernet over 8 Miles on 3Cms in the UK ?

Don't despair, Doug! I have the identical combination, and it works fine. You ask so many questions that it will probably take some days for me to prepare a reply. However, to be going on with, my advice is simple. Forget all about the RTTY switch setting and the RTTY connector. Use AFSK via the Packet switch and connector, and everything will be fine.

The terms "Packet" and "RTTY" on the FT990 are misleading. The former simply means it is an AFSK selection, and the latter simply means that it is an FSK selection. I have received loads of letters and packets from people with much the same problem as you. When they took my advice, their blood pressure returned to normal.

If you don't like the manual, then try reading one for the PacComm Pactor controller (licensed version of the German PTC controller). You'll soon come rushing back to Kantronics, crying that all is forgiven, hi hi!

Catch you later...

Hi Jim! Sorry mate, but IMHO it's simply no contest - the KPC-3 wins hands down. (Strange expression that; wonder where it comes from?)

I've never been over-keen on AEA firmware, and the PK-12 seems to confirm my prejudices. For example, I am a remote SysOp of a UK BBS (see below) and received a request from a user to have mail auto-forwarded into his PK-12 PMS. The request contained a plea to remove anything from the @ field, as if it contained anything, even his own callsign or his proper Hierarchical Address (ugh!), then the PMS would reject the message. This quirk was later confirmed by someone else, and by me. OK, so all I have to do is add a line to the FBB SWAPP.BBS file to remove the @ field, and that's exactly what I did, but why should I need to?

The KPC-3 is really small and neat, and my only minor gripes (which aren't unique to the KPC-3) are...

(1) You can only kill your incoming mail one message at a time, or use KM to kill the whole lot. There is no way of killing several selected ones at once on one line, eg K Msg#1 Msg#2 Msg#3 etc..

(2) The SR (Send Reply) command is not supported. This is rather annoying, but I suppose it's better than the PacComm PMS firmware which does support it, but fails to insert the @BBS field! We in the UK despair of PacComm *ever* curing such silly bugs in what is otherwise pretty good and cheap firmware, (it is widely used in homebuilt TNC-2 clones such as the BSX2, KFN2, TNC2-DL, STW and so forth, as well as in the commercial Tiny-2 TNCs).

Sorry, I digressed a bit there! My advice - go for the KPC-3!!

(Unfortunately I am not on commission, hi.)

PS: Make sure you get one with 128k RAM, which will enable you to allocate 100k for the PMS - nice.

PPS: I don't have a KPC-3 myself, but I've used them a lot, and have a KPC-9612 on loan at the moment, and my ususal beast is a KAM-Plus. The packet section of all three controllers is virtually identical.

Just to let those of you who make regular contact with any one in the Antelope Valley just north

of Los Angeles in the Mojave desert, that there is now a full time I-net link you can pop out on

in the Palmdale, lancaster, edwards air force base and town of mojave area.

The address is gw.ab6qv.ampr.org if you want to telnet, the mail address for the sysop is

ab6qv@gw.ab6qv.ampr.org. to address mail to any one in this area, send it to

CALLSIGN@GW.AB6QV.AMPR.ORG. This node will grow with a larger net as time goes on including a

six meter out put as well as a 2 meter and a 440 link.

hope this info was of help at this time it has a two meter out put.145.010

> Tony Schliesser, N8XJA
> Packet: N8XJA@N8XJA.#DAY.OH.USA.NOAM

Yes, there certainly is a specific reference, but it applies to digital
emission codes, not to a data protocol. That is to say, the rules define
the pattern of bits for a given character, not the byte patterns of the
character strings. As an example, you can write and use any secret
protocol you want if it can be sent by 5-unit ITA #2.

First, check the table in 97.305 for the band you propose to use. Then
check the numbered restrictions explained in 97.307, which also includes
some symbol rate limits. Last, check the list in 97.309a (and b if so
directed) to see exactly what codes are permitted.

Those who wonder about the commercial spread spectrum techniques should
continue reading through 97.311 to find the only approved hopping OR direct
sequence techniques allowed in the amateur service, and note the strict
logging requirements as well.

I've finally gotten around to adding mailto to the comments section at
the bottom of each of the pages.

For those not aware of mailto: If you have any type of Web browser
(graphical or text), mailto gives you the option to send the addressee an
e-mail message containing your comments. When your message is complete,
it is sent to addressee.

Please take advantage of the e-mail feedback now on both pages.

Remember, they are located near the bottom of each page of BARC and ARRL.

The URLs for each page are shown in my .signature at the end of this
message, but I'll still include them here.

Boston ARC Web page: http://www.acs.oakland.edu/barc.html

>
>de Brent (KE3KZ)

THS403 is a disaster in OS/2 if you are trying to play with multiple OS/2
VDM sessions on your box. The polling type TNC programs absolutely trash
the CPU and bring it to its knees.

A much better solution from this same man is XHS611.ZIP which contains
native OS/2 code. This file contains both THS for OS/2 and TAPR1/2 TNC's
as well as PHS for the AEA product line. PHS, this version, was written for
the AEA PK900, PK88, PK232 and can be used on the PCB-88 with some
tricks pulled to keep it from overwriting the <CR LF> it needs in host mode.

This version of the code, in native OS/2 threaded code, WORKS. It doesn't
trash my 19200K Zyxels running voice/fax and data on the same BBS line
at the same time, nor my own station control program that runs in a third
COMM session in WARP.

Although, with a great deal of effort at tweaking the session parameters,
one can get some of the other TNC programs to work in multiple COMM
sessions, the single aysyncronous comm channel IBM has so graciously
provided us OS/2 users, is just shared beyond the practical limit, in
my humble experience.

The other programs of which you speak aren't in English, at least in my
versions. For KISS mode TAPR2 TNC's they work nicely, but Peter's
XHS611 combo is hard to beat for a simple setup.

Cheers

From: rgm@bilbo.baylor.edu
Message-ID: <3md67IINN264@BUDS1.baylor.edu>
Source record: 44030

Hello all,
I'm looking to get started with packet radio this summer and am on a limited budget. Buying a new radio is out of the question, so I'm going to try to pick up a used one at a hamfest.
What I am looking for is either a dual band or seperate 2-meter and 70-cm radios that work well at 1200 baud and can be modified for 9600 baud without too much trouble. (I'm handy with a soldering iron, but don't want to mess with surface mount components if it can be avoided.)
Does anyone have any suggestions for radios (that are likely to be found at a hamfest) that fit this bill?
Thanks in advance,
Ross

You can save yourself some dough. A registered copy of BayCom 1.6 with a
printed manual is available through the Australian Amateur Packet Radio
Association (AAPRA) for AUD$35 a copy (posted within Australia).

> The dealer tells me that this version does support 9600bps
> operation via the parallel port, but will only connect to the BAYCOM
> 9600bps modem (due this month) for around AUD$200. I am lead to believe

> with other modems at this speed.

The modem it connects to is the BayCom PAR96 modem which has a proprietary
parallel interface. This modem is very new so the clone makers have probably
not come out with anything similar yet.

At 1200 bps the software still operates using the serial port.

Cheers ... Gerard VK2DAA

The best radios for 9600 baud packet are Motorola "Mitreks" - old taxi / police radios that are built like a tank - They are frequently found at swap meets - for about $50 - $100.

You will need a service manual (Motorola will sell you one) and some channel elements (with proper crystals) and some good luck - but you can get on the air fairly easily.

Good luck de Dave, kd6pro.

Unless you are quite sure that you'll not be working HF, I recommend that you look at the all-mode TNCs, which give Amtor and Pactor capabilities. Both the AEA PK-232 and the Kantronics KAM are good units.

On HF, packet doesn't amount to much except for automated stuff between VHF nodes. Real communications in real-time are mainly done via AMTOR and PacTor. These modes are a lot of fun.

Just a thought...

1566. My Baycom is deaf - Help!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-11 00:00:00 UTC
From: H14763@ptnnfs01.ESkom.co.ZA
Message-ID: <60AA8309B@ptnnfs01.eskom.co.za>
Source record: 44036

Hi All,

Firstly, my Baycom works fine with Baycom software. My complication is that when I try and run F6FBB with it, it seems deaf.

To complicate my problem-solving, the Baycom/Radio combo works fine with my PC at work, running F6FBB. At home with identical config for F6FBB, it doesn't hear incoming packets, or very few if any. If I exit F6FBB (at home) and boot up Baycom 1.5, it works fine, not missing a single packet.

By a process of elimination then, I assume the fault is not with the Baycom/Radio combo as it receives AX 25 fine with Baycom 1.5.

It might be the TFPCX interface that I use for F6FBB operation. Can somebody suggest a cure for my Baycoms deafness (no euthansia please!!)

Best regards

Brian Ellse

The 1274 is exactly the same as a 1270B plus the hf tuning indicator. Packet only (I think some of the later firmware does fax). Mailbox on the later firmware versions. Any TNC-2 compatible firmware will work. I would guess $50-75 would be typical. Look for one with 32k of RAM, the earlier versions had 16k, but it is upgradeable.

Not exactly. You need special software, since some of the TNC functions are done in the computer. The Baycom software is pretty neat, however. Also there is a packet driver available for use with tcp/ip software.

>and if so
what speed is it? (1200?)

Yes.

Although DOS, does it use graphics at all (other than PC block graphics) - i.e. does it operate in a text mode? I ask, because I am interested on behalf of some blind friends, who can use text modes (via a speech synthesizer if you're wondering), but at present graphics interfaces are in their infancy.
(Everything going gooey doesn't suit EVERYONE - I don't like it either, for that matter!)

1577. Request for information regarding RF data transactions

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-12 00:00:00 UTC
From: steveh@paradyne.com
Message-ID: <3mgh93$l1n@pdn.paradyne.com>
Source record: 43960

Among the several projects I have underway at this time, one is work related to development of a system primarily aimed at keeping track of the position and other critical navigation parameters (course, speed heading, etc.) of vehicles, typically ships in harbor areas. These systems typically consist of a navigation sensor located in the vehicle reporting to a central control site via an RF link. In the maritime community, use of Digital Selective Calling (DSC) techniques on marine VHF frequencies has been proposed as a standard. This type of information management has been generically called Automated Dependent Surveillance (ADS). Use of DSC, an international standard, is important since the vehicles in this case (the ships) move between many independently controlled port management/surveillance systems.

For the record, DSC is a 1200 bps FSK based signalling technique demonstrating most of the packet type characteristics used in more modern protocols such as separate transmit and receive address fields, message priority management and limited error detection and correction. By international agreement, it is defined for use on the marine MF/HF and VHF frequencies (25 kHz channel spacing for the VHF systems although 12.5 kHz is coming very soon). Most ADS implementations use marine VHF since harbor areas tend to be small enough in geographic extent and the MF/HF signaling is done at 100 bps, deriving the reporting information from an on-board differential GPS.

The point of this posting is to ask a couple of questions related to this particular application:

1. The signalling technique in use today is rather slow and loaded with over-head for the amount of actual data passed in a single transmission. These two factors combine to limit the capacity of such a monitoring system, limits which must be overcome in order to design a system which really enhances the monitoring performed in a port environment. This first question is therefore aimed at soliciting suggestions for improving throughput. Each factor can be treated separately as follows:

a: What throughput rates are reliable using today's hardware? Remember the factors, moving antennas, 156-162 MHz, 12.5 kHz channel spacing.

b: Associated with a), what is the modulation technique associated with the stated bit rate?

c: At this time, the transmission method is being considered for change, not the protocol. However, is there another "well defined" protocol or format which could be adapted for use instead of DSC? "Well defined" in this case means some sort of adopted standard, not necessarily an international version, but at least industry level recognition.

2. My expertise in this area is in the system configuration and software development rather than hardware and RF. What companies produce RF modem equipment?

3. Not a question, but I am searching for a supplier of the RF hardware and associated firmware. If capable (volume requirements are currently low, but I know that is going to change, VERY price sensitive, but what isn't?) please respond and I can discuss more details.

I am fully aware that what I am doing is nothing new. Vehicle tracking systems are common in a number of uses today. My application is only unique in its requirement to use an international standard since the vehicles are not captive to a tracking system.

I welcome comments from users, knowledgeable individuals as well as system or equipment producers. Please send information to my e-mail address or use the phone numbers. Note that the phone number is a shared office answered under the primary business name of "Challenger Enterprises." I am cross posting this request to several seemingly unrelated newsgroups in hopes of finding more than a single answer to my questions.

Is there a FAQ or recommended book, or any literature on packet radio?
I am most interested in the protocols used, how it connects to the
Internet, what API toolkits are available, how the nodes are
connected, what wavelengths are used, what antennae are required, and
who are the popular vendors of digital radio equipment. I have heard
of AMTOR (sp?). How does that tie in with things? I guess I am trying
to understand the entire process (every detail) of how a message that
I might send to a friend halfway around the world would get there and
be retrieved by my friend. Once I understand the process, I want to
buy equipment, get a license and start playing with the setup. As is
probably evident from my questions, I am a complete novice at amateur
radio. Any help will be greatly appreciated. Thanks!

(Re: speed, weak points, specs of GTOR and PacTOR.)

Hi.
I have a few notes about Gtor and Pactor that I thought I'd pass
along.

Packtor is a merging of the Amtor and X.25 protocols. Amtor had some
limitations on its maximum usable distance, since it uses a very rigid
timing between the transmitting and receiving station. This limit is
around 6,000 miles, or so.

Packtor's main advantage over Amtor is data integrity (there is a CRC
code sent with each packet). Packtor's advantages over X.25 are its
reduced complexity, and its use of a digital compression technology called
Huffman encoding to speed up the connection's data throughput.

Packtor is alive and well, especially on the HF bands.

One of Packtor's weaknesses is that it (like X.25) requires alot of routing
information to be passed along with the signal, thus decreasing the overall
system throughput.

Gtor was developed by 4 engineers from Kamtronics, Inc. Gtor's main
advantages over Packtor are - speed (Gtor can be up to 4 times faster than
Packtor in getting a message through); IMMUNITY TO ATMOSPHERIC
NOISE AND DISTURBANCES, due to a very cleaver data-interleaving scheme, and
the ability to actually "fix" any garbled data using mathematical data-
"repair" formulas.

Gtor uses 100 baud, 200 baud, and 300 baud speeds. All ACK/NAK's are sent
at 100 baud. If a transmission is being successfully copied by a receiver
at 100 baud, then the sender switches to 300 baud. If the receiver has
difficulty receiving 300 baud, the sender drops down to 200 baud. If there
is still trouble, the sender drops to 100 baud. But the main attempt is to
communicate at 300 baud.

I don't know of any known problems with GTOR, as I believe it represents the
latest round of innovation in the digital communications arena. There is talk
of a German-led effort currently underway to bring a sort of "Token-ring"
type of protocol out. This would make the most of crowded frequencies, and
might be even more advanced than GTOR, BUT - I believe that the HF (or clear
frequency) modes like GTOR will require a totally different approach than
VHF (or crowded frequency) modes like this Token-ring-type approach. BOTH
have their application. I believe GTOR is the "best" (very subjective) for
HF and/or clear-channel work. I don't know of any detractors to this mode
except perhaps that it is not suitable for broadcast (it requires the ACK/NAK

and speed-synchronization of the receiving station).

AMTOR-B or Pactor might be best for some HF applications.

I believe that there is a program with the rather strange name of 'Ingocom'
for the ST. It exists in two versions; v1 about which the less said the
better (hi), and a rather more stable v1a. Sorry I cannot help on a source,
but at least you know what to ask for now!

I am using the FT-990 with the Kam Plus. Using Host Master Software. Works fine on all modes. If you want more sophisticated software you can go for KaGold, but you don't need it unless you intend to run a CD-Rom.

The fellow who told you to use AFSK is 100% correct. It is the easiest way to go and should solve the problems you are having on RTTY. For more info on this contact Scotty Neustadter (scotty@iquest.com). He has a whole file he can send you on this.

The other thing you should do is subscribe to the FT-990 group. It is 990@xyzoom.alegria.com. There is generally someone in the group who can solve any problem you are having with the 990. You will also get all the messages being sent by members of the group. Great rig and works good on all digital modes. I just wish I could find some G-TOR activity.

Good luck es 73 de Jay, KD2L

Source record: 43973

Hello all. I'm trying to run nos using a baycom modem. It works fine when doing "normal" ax25 connections, but when i try to use ftp, it connects and gives the ftp prompt (ftp>), and from there it behaves screwy. When I ask for an "ls" and the other station sends its files, I won't decode them!...I can hear the long packets on the receiver, but I won't see them on the screen. from there on it locks and I have to forcefully close the connection. The same happens with telnet, I can connect, but can't do anything.

I know it's working more or less, but for some reason I'm not decoding the "long" incoming packets. (when using the baycom program to run normal ax25 it does decode "long" packets")

The computer I'm using is a 286, 4Mhz.

Any ideas, maybe it's that the computer is too slow.....HELP!!!

please email replies!

73 and thanks de Luis Orozco N5UHB/XE2MXU

AA>
AA>Hi guys!
AA> How about a little help for a couple of little lost sheep who
AA>are (probably) going astray. We are attempting to get some 9600 baud
AA>packet activity going on here in Panama. The problem is that we are
AA>both rookies at this speed. Henry, HP1CDW is running a PK-900 and I
AA>am running a PK-96 into an azden 9600D. The problem is we cannot
AA>connect. I
AA>guess the question is: What the heck does 9600 sound like? I can
AA>hear definite tones from the PK-900 but the PK-96 seems to make only
AA>whilte noise at any deviation. level. Which one is sounding good?
AA>The 1200 baud from the PK-96 works fine (same for the 900) so we
AA>know the cables are properly wired (AFSK output comes from the same
AA>pin, no matter whatthe speed). No one here has ever run 9600 so we
AA>have no leareeee lead to follow. Appreciate any help we could get.
AA>TNX
AA> Otto, HP1XNE/KV7J

We are also trying to get 9600 up and going in this area. It sounds more like just plane noise than does regular packet. One thing that we have found is that the deviation level is much more critical than on 1200 Baud. Most of us have been pretty sloppy at 1200. Well on 9600 we found that we really needed to set things up with something that can actually measure the deviation. We set it to 3 KHz and all seems to be fine.

Now we are looking for how to modify some of the Motorola Syntors that we have for 9600 rather than spend a lot of money for new 9600 ready stuff.

Gidday

I have an old Minsicribe 3650 HDD that I really need to get some
information off before it gets thrown in the bin.

I believe it is suffering from the index bar on the back of the stepper
motor needing adjustment and from my dark past I remember seeing a
technote on doing just that.

I know it has to be loosened and moved but by how far and what direction
I don't know.

Has anyone got a copy of that note or the information for me to try it.

Many thanks..

Greetings,

The Northern Corridor Radio Group in Perth Western Australia is looking for information in setting up a packet cluster station. I have been a BBS SysOp for over 5 years, but have only come across vague references to it & really know very little.

Could anyone with appropriate info fill me in as I will pass it onto the interested members in the club. There are quite a few avid dx'ers in the club who also have packet access & wish to utilize it.

Tnx in advance for any info.

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc

A friend of mine told me via a local Boston repeater of an AMPRnet conference bridge we was on, which he believed was in San Francisco.

He couldn't remember the call, but thought it was ke6ocs. I checked, and that callsign doesn't exist.

He said that at 7:30pm Pacific, there was a net on that system called something like the Buffalo net.

Anyone know the address of the AMPRnet system? Of the Internet <-> AMPRnet gateway?

Thanks much.

George J. Ramirez
24511 13th Pl. So.
Des Moines, WA 98198
Ph: (206) 824-7180 Wk: (206) 655-5568

SUMMARY OF QUALIFICATIONS:

Strong Electronic and Technical Writing background. Strong experience in research, design, and planning of electronic systems, including Fiber Optics. Ability to learn quickly and accurately assimilate knowledge. Ability to Work independently or in a team concept as required. Network installations. Thorough experience with PC's (Repair, hardware, & software). Strong Electrical background including Numerical Control. Strong metrology background.

EXPERIENCE:
NETWORK:
In the past 6 years I have installed network systems at the Boeing Customer Service Center. This included hardware and software. I installed Windows for Work Groups, Windows NT, and Lantastic 6.0 just to name a few. I am familiar with others as well. When I worked on the Free Electron Laser at Boeing Radiation Laboratory, I installed the entire Data Communication Link, from it's design stages to completion. This includes fiber optics design and data acquisition design. In more recent years, I have been one of the Boeing Flight Test Calibration Laboratory focal points on their network software and network applications. These applications include: Windows for Work Groups, DEC Datatrieve, Transera IEEE and Flight Test Computer Services (FTCS). As a personal hobby I have been working, (Freelancing) for small Businesses regarding their LAN systems. I give them advice using their own computers, and software suggestions. I also spend time enhancing their personal computers.

OTHER:
Boeing Commercial Airplane, Seattle Wa
05/89 - Present FLIGHT TEST TECHNICIAN
As a Metrology Technician in Flight Test I perform calibrations and maintenance on test equipment for Flight Test and the Boeing Engineering Labs. Equipment includes; Precision Digital Meters, Oscilloscopes, Synthesizers, Generators Waveguides, Spectrum Analyzers, Attenuators, Power Meters, etc... Calibrations include Radio Frequency (RF), Analog, and Digital electronics. RF Calibrations are in the 50 Megahertz to 18 Gigahertz range. The Job includes balancing and scheduling of work being performed, Technical writing and parts acquisition. I participate in meetings to familiarize the lead and

supervisor on special tasks and job progress for priority one jobs. Part of the job also includes facilitating a team concept with my work companions. The job is fashioned around an electronic laboratory; in which I Calibrate, Troubleshoot, Maintain, and Repair -to component level- all aspects of Flight Test equipment. Evaluate and write procedures as required. In the last four years I received two promotions in recognition of my technical growth and exceeding job expectations.

10/85 - 05/89 Boeing Commercial Airplane, Seattle, Wa.
ELECTRICIAN
My responsibilities as a Facilities Electrician was to remodel, modify, and maintain building facilities. Other responsibilities included Construction and/or Demolition of building electrical systems, and Electrical system layout (per code). I also repaired various types of equipment such as; light fixtures, power panels (install & maintained), any appliances or test equipment that need electrical attention. Primarily, jobs were launched with location and electrical drawings, and from the drawing I was to administer in a timely manor the completion of each job including parts procurement. Assignments also included training of personnel, operation of heavy equipment, the repair of electrical motors (high and low power). Secondary responsibilities included: Repair and calibration of oven/environmental chambers, installing Network accessories (i.e. pulling cable, installing buffers and data transmission lines, PC cards, verifying proper operation after network installations), and hooking up phone lines.

10/84 - 09/85 Systematix Controls, West Seattle
IN HOUSE SERVICE SUPERVISOR
Developed a new product for the paper and pulp industry, utilizing the Intel Micro Processor and solid state electronics. This included contributing my expertise in Technical writing, design, and troubleshooting, (both software and hardware) to the production of the product using Intel technology. The job also included parts ordering, administrative skills, and people skills to expedite the production of the company's product. I made presentations to the Lead Engineer, Production Manager, and to the President of the company on the products progress.

11/82 - 09/84 Stellar Systems, San Jose California
LEAD ENGINEERING TECHNICIAN
Tested and designed new products in the R & D Lab. After my promotion, I was responsible for manufacturing support and in house customer service, as well as R & D. Main focus was the design of a new product called H-Field. This involved bread boarding, debugging to component level, aiding in design changes, and meeting customer needs for testing, both in house and with outside customers.

EDUCATION: Currently continuing my education at City University in Business Management.

History: Bay Valley Tech in Santa Clara California certificate of completion in electronics. 1978
Two Years at San Jose City college (General Education, and Sports). 1980
Two Years at Foot Hill college in Los Altos California, with a certificate of completion in Electronic Engineering. 1983
One year refresher course in Electronic Engineering. 1984
Two Years at South Seattle Community college, with a certificate of completion in Avionics. 1993.

Boeing training: On the job Training as an Electrician at Boeing Aero Space 1987 to 1991
On the job Training in Numerical Control 1985 to 1986
People Skills 1993,1994.
Leadership 1993,1994.
Innovation-applied to organizational problem solving 1994.
Creative thinking- applied to people skills and problem solving 1994.

Additional: My special training and enjoyment is in Electronics; Digital, Analog, Radio Frequency, Radio Communications, and Computers (software and hardware). I'm a Boeing Certified Electrician and a Certified Hazardous Chemical Technician. I also obtained an FCC License, CPR Certification, First Aid Training Certification. I have extensive training in the handling of hazardous chemicals.

Tnx for the reply, Charlie! I really don't think it is the wiring, because I have been using the same equipment for a few years using the Baycom software, so I know of no reason why the SP program would demand a wiring change (I also see no mention of that in the SP docs).

Have you ever used SP with a "Baycom" modem? I would appreciate any other ideas you may have.

This sounds like something besides a MBX upgrade board. The AEA MBX daughter
board plugs into ic sockets and has one wire that solders to the mother board.

This might be one of the old 2400 baud add on boards.

Cheers

: >
: >--
: >enough is never enough

: Some suggestions. If you ever expect to expand your station operations to
: multiple comm port work, you had better avaoid ALL TNC programs that do
: not let you specify other than comm port one or two. You also must get only
: those programs that let you specify the desired interrupt number as well as
: the comm port three or four.

: That reduces the available choices to very few.

: Then, look around long enough to get only a TNC program that uses a fully
: interrupt driven comm routine. If you ever intend to multi-task this program
: the conventional way of handling the comm port by a polling process is sheer
: suicide on your CPU.

: You can solve some of these problems of multi-tasking with DESQVIEW, and,
: intruth the NOS.BPQ switch stuff is written for it.

: However, if you intend to go to OS/2 of any kind, the choices shring to almost
: none. To get a clean fully functional OS/2 operation that can multi-session
: with other operations, about your only choice is the VHS611 series written by
: HB9CVV, Peter. It has DOS comparables, but generally works for the AEA
: series and TAPR1/2 clones, that I know about.

: That includes the AEA PK900. BPQ408A is now out in beta for OS/2 switch
: work. It handles the DRSI cards, AEA and others. Be VERY careful to spend
: some real time researching this or you will be very sorry about what TNC
: you bought when upgrade time comes to OS/2.
:
: Mike @ W5WQN

Paket 6.* is good but I personally always go back to lan-link. I wish
lan-link would incorporate switching windows like paket 6

From: hamilton@BIX.com
Message-ID: <hamilton.797962817@BIX.com>
Source record: 43893

drayegon@america.com writes:

>Doug the problem is not the Kam it is the software you are using.

Actually, I've since discovered that the real key problem I was having with RTTY was that the FSK input on the RTTY connector is inverted from the normal FSK output of the KAM+. There are two solutions:

1. (Which a number of folks suggested and apparently use with success) is not to use the FSK input at all and instead use the AFSK input on the Packet connector on the FT-990, connecting that to the AFSK (Transmit Audio) output of the KAM+. Obviously, to make this work, you should press the PKT button, not the RTTY button on the 990, for all digital modes.

2. You can also use the KAM's FSKInvert command to simply invert its signal output. This is the wire I'm now setup, so I do use the RTTY button for RTTY/Amtor/Pactor and it does work just fine.

Which is better? Good question for which I make no claims of an answer. But I do note that in the ARRL's "Your RTTY/AMTOR Companion", there is some discussion on page 2-11, which includes the comment, "the oscillator/ modulator in the transceiver may be superior to the one in your MCP or TU. By using the FSK input, you'll gain a superior signal."

Source record: 43894

The one really serious detraction (in my judgement) from GTOR is the lack of support in the current generation of the KAM Plus TNCs for listening to a GTOR QSO in progress.

As you tune thru the band, I think what most of want to be able to do is at least look at the callsigns, QTH's and quick sense of whether any given QSO is a typical short DX or ragchew. If it's a good DX, I want to wait 'till it's over and try to link up myself. I generally expect that's what the DX station is hoping I'll do also.

But with GTOR, the TNC just doesn't support that third party listening. You hear the noise but have no idea what's being said, where it's coming from or how long it might last. This is the ultimate of being put on hold and having no idea if you should just hang up and try again later.

Okay, yes, I know, you can do the monitoring in software outside the KAM, but come on: that's a complete cobble. This should have been in the KAM itself.

As such, I gotta say: GTOR, however technically wonderful it might be, is, in its present incarnation in the KAM Plus, a total waste except for ragchews.

Source record: 43895

>>Using KPC-3, trying to install Host Master software the program freezes during the initialization stage. It works on my computer (PPC 6100) but not on another computer (Performa 475). We've tried it with extensions off and still no avail. Any ideas? Thanks

Some older MAC's needed a control panel called Serial Switch but I don't think is your problem but check to see that "Serial Tool" is in your Extensions folder in the system folder. You going to need some extensions so don't turn all off.

I am using same TNC and software on a MAC II and a Mac IIFX under system 7.01 to 7.5.1

I'm certain that Kantronics would have put a GTOR monitor mode in the KAM if they could have - the fact is that the CPU in the KAM just isn't up to the task. It's not fast enough.

Another problem with GTOR is the effects of multipath on 300 baud FSK signals. Sometimes the signals will be fine but you just can't maintain a 300 baud link, and multipath is often the culprit.

Of course, the biggest problem with GTOR is that, despite all the hoopla and the number of KAMs sold, there just aren't many people *using* it. I can always scare up a Pactor or AMTOR QSO, but GTOR QSOs are few and far between.

1611. Extra memory in TNC3S -> what can you do with it?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-15 00:00:00 UTC
From: skrol@inter.nl.net
Message-ID: <D73HHy.HqB@inter.NL.net>
Source record: 43897

Haai there,

A friend of mine has a TNC3S with 64k memory. He said that the memory could be increased to 1MB. He asked me if it's possible to put a tcp/ip program (like jnos) and a netrom program (like g8bpq) in that memory, so it could be running without the use of his computer memory.
Does someone know anything about it? Or what can you do else with that memory?
Please let me know.
Thanks in advance.

Greetings from the Netherlands.

1612. Bug in JNOS110i retransmission timer display?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-15 00:00:00 UTC
From: skrol@inter.nl.net
Message-ID: <D73HKC.Hr3@inter.NL.net>
Source record: 43898

Haai there,

I'm running jnos110i on my pc now. It seems to work fine, but i noticed some strange things :

- On ax25 connections (probably also on tcp connections) the retransmission timers differ from the real values. I've my max retransmission timer on AX25 connections at 25 sec. That seems to work fine, but the displayed retransmission time is 160834 ms!
- When you give the command : mbox timer 7200 (AX25 forwarding every 2 hours) and after that i give the command : mbox timer (to show the current value) is gives 7318 as value.
This is also with smtp timer etc etc...

Does someone know if this is a beauty bug (which I shouldn't worry about I guess) or is something else wrong?

Greetings from Holland,

Sjoerd.

1613. Ausie Packet BBS Addresses needed

Greetings,

I have a friend from the US being transfered to Mackay Aus. in a few months
and I am in need of Packet BBS Address for the Mackay area and any for
Sidney.

He will be based in Mackay and is wanting this information before he goes
to make sure he has all the proper equiptment together to take with him.

If someone would send me a list of the Packet BBS's in Mackay and Sidney
we would be most thankful.

>--
>enough is never enough

Some suggestions. If you ever expect to expand your station operations to multiple comm port work, you had better avaoid ALL TNC programs that do not let you specify other than comm port one or two. You also must get only those programs that let you specify the desired interrupt number as well as the comm port three or four.

That reduces the available choices to very few.

Then, look around long enough to get only a TNC program that uses a fully interrupt driven comm routine. If you ever intend to multi-task this program the conventional way of handling the comm port by a polling process is sheer suicide on your CPU.

You can solve some of these problems of multi-tasking with DESQVIEW, and, intruth the NOS.BPQ switch stuff is written for it.

However, if you intend to go to OS/2 of any kind, the choices shring to almost none. To get a clean fully functional OS/2 operation that can multi-session with other operations, about your only choice is the VHS611 series written by HB9CVV, Peter. It has DOS comparables, but generally works for the AEA series and TAPR1/2 clones, that I know about.

That includes the AEA PK900. BPQ408A is now out in beta for OS/2 switch work. It handles the DRSI cards, AEA and others. Be VERY careful to spend some real time researching this or you will be very sorry about what TNC you bought when upgrade time comes to OS/2.

1619. WISP Help Needed

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-15 00:00:00 UTC
From: Gerald Schmitt <ggs@aerie.lanl.gov>
Message-ID: <3mq9c6$h6e@newshost.lanl.gov>
Source record: 43987
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

OK folks I give up. I need some help. I am running WISP with
a KPC-9612 trying to access the pacsats. Rig is FT-736
with the GB3RUH mod for 9600 baud. Antennas and rig are
controlled by a Kansas City Tracker card. I have optimized
the TNC for transmit with a AEA DM-1 and it is right on 3kHz
I also optimized the receive per Kantronics instructions.
The antennas point and the rig get tuned. The 9600 baud signal
breaks right through the squelch, the port 2 receive light comes
on solid, the connect light flickers. On the bottom of the status
display for msre the "T:" display racks up bytes at a great rate
but at the end of the pass I have nothing but KISS files for my efforts.
I would guess I have something set wrong but I can't figure it
out. For the first effort I am just trying to get a directory
so no joy. Any help will be greatly appreciated.
By way of my contribution I played with the mike drive on the 736
with the deviation meter in line and found no change in deviation.

There are quite a few people running TCP/IP under Linux on Intel-bases machines in the UK, and there must surely be plenty doing the same in the USA?

>
>

I run a KAM-Plus and an FT990. I haven't measured the AFSK voltage on a
'scope, but I have arranged it so that the Mic gain control can stay in
exactly the same place whether I am operating voice or data. (I use
AMTOR/PACTOR/G-TOR.)

BTW, if you are running the rig 'barefoot' (no linear) then it's a good idea
to keep the output power down to, say, 80 Watts. The difference compared to
100 is negligable in terms of signal strngth, but on these solid state PAs
it makes a hell of a difference to the signal purity.

Hi, I have a problem that I hope some of you can help me with.
This is the scenario:
My father-in-law is on a sailing boat in the West Indies. He has a radio-amateur-unit and his computer connected to it. He uses some software called Pactor or/and Packet.
I my self is located in Stockholm, Sweden and have a Macintosh connected to the Internet.
The problem is:
Can I, through some kind of server, send messages to my father-in-law? Or in opther words, is there some kind of computer on the Internet that can transmit my message (including a call-signal) to a radio-amateur unit?
Here is some data about the my father-in-laws equipment:
SM=AFBNF/MM, Rig: ICOM 725, AH3, AEA, 232 MBX, Philips PC, Ant: 17m semi vertical.
(at this present time he is in Sweden but he will be back in the West Indies by the end of april. If you want you could allways give him a call, he will be crossing the Atlantic and will certenly need some encouring conversations)

Please answer via e-mail since I don't frequent this newsgroup to often, many thanks from

Subject: Packet Radio FAQ/Book/Info?

>>Is there a FAQ or recommended book, or any literature on packet radio?

Just saw an interesting-looking new title in this month's ARRL magazine, QST!, that you might find attractive. Covers all the packet topics you mentioned.

There's also a BBS in SoCalifornia that has many packet programs and textfiles - it's called ATTENTION to Details at 909-681-6221. No fees involved to get access to over 9,000 Amateur files.

Check out:

Packet Raido and TAPR is on the World-Wide-Web!

The series is accesible through the Packet Radio Home Page at this
URL:
http://www.tapr.org/tapr

What's here? A page of links (the Home Page), the TAPR Home Page, a page of
Packet Pioneers and Contacts, a hypertext packet primer and FAQ, and more.

Does anyone have a reservation for Dayton that they won't be using? My
10 year old son has decided that he would like to attend this year for the
first time (he was licensed as Tech+ last summer). Unfortunately, that
will require that I find us a room ... something I hadn't planned on before!

If anyone can help, please resond to:

Doug,

The third alternative is to set the RTTY TONE switch (under the top access
panel) on your FT-990 for REV. Yaesu put the switch there just for this kind
of situation - since there is no standard as to which is mark and which is space
(key up or key down).

I think it is mainly a display problem which occurs with the 386 compile.
There is a fix to the pcgen.asm routine available on pc.usl.edu which
will give the proper display.

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

1645. NEWBIE: Can I use IC2700H and mfj 1278 on packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-17 00:00:00 UTC
From: a-rickf@aladdin.tandem.com
Message-ID: <D76tME.17n@ac.tandem.com>
Source record: 43928

I'm a "newbie" to packet radio, and would like to put a
station on the air in the San Jose area. I should have my
Icom IC-2700H soon, and have an MFJ 1278. Can these two
play together as a reasonable packet station?

Has anyone connected an Icom 2700H for packet? If so,
what were the problems/gotchas that I should avoid? I've
been working in the comupter industry for years, so I've
never been all that interested in putting a packet station up,
due to easy availability of Usenet/Internet connections.
Now I realize there's more to packet than just the Internet
connectivity.... Took a while, I guess I'm just a bit
thick now and then....

The mfj 1278 still has it's original 300 baud modem, and I
assume I'll need at least a 1200 baud modem for it, and
possibly 9600 baud, depending upon what's going on in the
bay area.

I'd appreciate any suggestions that you can provide....

Thanks - Rick
KD6QZD

1646. Packet Mac contact info?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-17 00:00:00 UTC
From: Walter Daniel <wk02593@worldlink.com>
Message-ID: <3007215369.1.wk02593@worldlink.com>
Source record: 43929

Does anybody have contact info for the folks who make/sell the Packet Mac modem? It's similar to the Baycom PC modem (i.e., a serial port packet interface with TNC code in software). I checked the most recent issue of QST but found no ads. I think I've seen ads in 73, but I'd appreciate any help in finding them.

I think these folks also sell the Mac packet program Savant to be used with the Packet Mac modem.

Thanks and 73, Walt KE3HP

1647. msdos or windoze program using Soundblaster as a TNC?

Newsgroup: rec.radio.amateur.digital.misc

From: wa2ise@netcom.com
Message-ID: <wa2iseD7745J.2Es@netcom.com>
Source record: 43930

Is there any software (shareware or freebees?) that can make use of a soundblaster 16 card to "fake" the transmit and recieve functions of a TNC? And the program taking care of the other functions? Maybe use a line on the serial port to key the mic? (via simple outboard circuit?).

Or is there something vital missing to make this impossible or lousy performer?

Actually, I can't think of many things for which Kenwoods are "best".
Perhaps they are best at being unreliable, or perhaps best at being
inefficient, or best at receiving intermod, or best at arcane user
interfaces, but they certainly aren't best at packet, especially not
9600 baud packet. On the other hand, according to the May QST lab tests,
the Azden PCS-9600D *is* the best 9600 baud packet rig available right
now. Wiring couldn't be easier, just connect to the DIN plug marked
DATA IN/OUT right on the front panel.

1653. Internet to MSYS BBS mail gateway service

Newsgroup: rec.radio.amateur.digital.misc
Date: 1995-04-18 00:00:00 UTC
From: Gary Crum <crum@xmission.com>
Message-ID: <3mve5k$q5b@news.xmission.com>
Source record: 43793

Here's what is undoubtedly a Frequently Asked Question, but not in the current FAQ (ftp://oak.oakland.edu/pub/hamradio/docs/faq/):

Is there a way to send mail from the Internet to the network of MSYS BBS systems, and vice-versa?

In my area, Utah USA, I think a couple guys have intended to provide this service because they run MSYS BBS systems with TCP/IP support, but their systems are apparently not functional.

Thanks for any info and pointers to info, and I think I will also post this query to a USENET group -- rec.radio.amateur.digital.misc, perhaps. I have browsed around a few web pages, asked around, and read some printed literature, without finding a working mail gateway so far.

Gary

According to some lab tests written up in the May QST, better BER is almost always achieved with Yaesu-Kenwood-Icom FM radios by using as *much* deviation as is compatible with maintaining the spectrum inside the allowable channel bandwidth (In fact, deviations modestly in *excess* of 5 kHz are best). Most amateur FM receivers, if the EQ is bypassed, have acceptable characteristics, but most amateur FM *transmitters* truly suck for 9600 baud packet. That's because most use a synthesis loop design that limits low frequency amplitude and phase response of the audio channel that is critical to successful 9600 baud operation. There are exceptions. The IC-820H, the Tekk-900, and the new Azden PCS-9600D do their modulations differently. They modulate an intermediate oscillator *outside* the synthesis loop, and then hetrodyne that with the synthesizer to achieve channel frequency. That gives near ideal response, and netting several such radios becomes a cinch. Of the three, the Tekk is by far the most cost effective (it avoids the synthesis loop problem differently, it's straight crystal controlled).

When you start raising the baud, using an RF system *designed* for the mode becomes more and more important. Kludging FM voice radios into data service often becomes an exercise in futility. That's why the GRAPES design eschews such kludges and directly generates RF for 56 kb operation. Since the responses are ideal for the baud, they interoperate beautifully without any need to tinker. With synthesized voice rigs, even radios of the same model often need considerable tweaking to get them to work together. Normal component tolerances disturb the low frequency phase response sufficiently to make netting several a frustrating experience.

>play together as a reasonable packet station?

Well, those two wouldn't be my *first* choices, but they'll
work together at 1200 baud.

>The mfj 1278 still has it's original 300 baud modem, and I

The 1278 has 300 and 1200 baud modems built in. 9600 will
require an accessory modem. Trying to get a IC-2700H to
play 9600 baud with other radios can be a challenge (one
I'd avoid if possible).

I can't speak for the Bay Area, but around here all the
9600 baud activity is on the 70 cm band. The Tekk 900
crystal controlled radios are among the easiest to get
going, cheapest too.
